Dams Within Jurisdiction of the State of California

Bulletin 17-79
December 1979

ON THE COVER: New Bullards Bar Dam and Reservoir, the second highest dam in California is a variable radius arch dam. It is located approximately 14 miles northwest of Nevada City on the Yuba River North Fork in Yuba County. The dam was completed in 1970 and first certified for full storage in 1971. It is 193 metres (635 feet) high and when full, the reservoir contains 1,196,500 cubic dekametres (969,600 acre-feet) of water. Characterized as a multiple-purpose dam, it provides water for domestic uses and irrigation, recreation, and hydroelectric power generation. It is owned and operated by the Yuba County Water Agency.

FOREWORD

Before 1929, California exercised only limited supervision over dams; its jurisdiction actually extended to less than half the dams then existing. In addition, a few dams were under federal supervision. When on March 12, 1928, the failure of St. Francis Dam in Southern California resulted in a major disaster, the Legislature responded by enacting new dam safety legislation which became effective on August 14, 1929. Thus, 1979 marks the Golden Anniversary of California's dam safety program. The subsequent failure of Baldwin Hills Dam in 1963 was followed by additional legislation, which took effect on September 17, 1965, providing for State jurisdiction over offstream storage facilities and over the entire reservoir, as well as the dam.

Today, provisions of the Dam Safety Act are administered by the Department's Division of Safety of Dams. Engineers and geologists of the Division review plans and specifications for construction of new dams, and for enlargement, repair, or removal of existing dams. When a new dam is proposed, Division personnel investigate the site and the construction materials, and identify any conditions that may require design changes. After making certain that the proposed site and the plans are in accord with the Dam Safety Act, the Division then issues formal approval, allowing the builder to begin construction. While a dam is under construction, Division personnel make frequent checks for compliance with approved plans and specifications.

Before a completed dam may be operated, the Department of Water Resources must issue a "Certificate of Approval," attesting to the safety of both the dam and reservoir. It may contain restrictions and it may be amended or revoked.

The Division of Safety of Dams periodically inspects operational dams to determine whether conditions have developed that could be hazardous during normal operations or during emergencies, such as floods or earthquakes. Should Division personnel identify such hazardous conditions, the Department directs the dam operator to correct them. Division personnel also reevaluate the safety of operational dams whenever advances in the technology of structural analysis or hydrology reveal the need for new studies. The San Fernando earthquake of February 9, 1971, resulted in increased public awareness of seismic risks and stimulated advances in the state-of-the-art in dynamic analysis of dams. Since that time, the Department has made a determined effort to reconsider the seismic safety of all California dams through new applications of computer technology in conjunction with dynamic testing of material properties.

In the past four years the Division's program has been expanded to include review of major federal projects where there is high public interest. One such project under review is the proposed Auburn Dam. The Division is also conducting the Federal Dam Safety Program in California authorized by the National Dam Inspection Act for the U. S. Army Corps of Engineers.

In administering the Dam Safety Act, the Department must comply with the provisions of the California Environmental Quality Act of 1970. In compliance with the Act, all formal approval and revocation actions must be preceded by appropriate environmental documentation.

Our dam safety program has become widely copied. Its success is due to those professionals who guided and administered the program in its early years and to their successors, whose leadership was crucial during the phenomenal increase in jurisdictional dams in the decade beginning in the mid-1960s. The achievements of fifty years of dam safety cannot be contemplated however, without a haunting remembrance of those hundreds of men, women, and children who never saw the dawn on that March morning in 1928.

Data in this bulletin relating to dams under State jurisdiction were obtained from applications and plans submitted by owners and from surveys and supplementary information acquired during inspections and special studies. Data on federal dams and reservoirs, which are not subject to state jurisdiction, are also included in this bulletin. The Department of Water Resources gratefully acknowledges the assistance and cooperation of the federal agencies that provided this information.

The Department always welcomes suggestions for additions and improvements from users of the Bulletin 17 series. You may address them to the Division of Safety of Dams, Department of Water Resources, P. O. Box 388, Sacramento, CA 95802.

FIFTY YEARS OF DAM SAFETY

California's program of dam safety was 50 years old in 1979; however, the building of dams for water storage has been going on for centuries. The Division's records reveal at least 90 jurisdictional-size dams constructed before the turn of the century that are still in operation in California today. In fact, two dams constructed in 1850 during California's Gold Rush period are still operating, as are numerous other old dams for which construction dates are unknown.

The present program to assure that dams in California are designed, constructed, and maintained in a safe condition was established as a direct result of dam failures or other disasters. These incidents moved the people of the State and the California Legislature to enact laws that would protect life and property of those living below dams.

From the beginning of California's involvement in dam safety through about 1917, there was little regulation or supervision over the site selection, design, and construction of dams. Maintenance and inspection of existing dams were performed only as deemed necessary by the operating agency or owner. The authority to enforce or police such facilities for safety in maintenance and operation was not given to any one agency. In 1917 the State Engineer and the Railroad Commission had divided authority over dams in the State.

Some examples of construction early in this century include Lake Hodges, Calaveras, and O'Shaughnessy Dams. Lake Hodges, owned by the City of San Diego, is pictured below. Construction began on May 15, 1915,

and the concrete-masonry multiple-arch dam on the San Dieguito River was completed on January 29, 1919. This photograph was taken during an inspection of the dam in March 1919.

Calaveras Dam pictured above as it appeared in late 1943, is a hydraulic earthfill dam. This dam, owned by the City and County of San Francisco, is located on Calaveras Creek in Alameda County, and was completed in 1925. The next photograph, taken during an inspection on September 21, 1978, looks upstream at O'Shaughnessy Dam, a curved gravity concrete dam constructed in 1923 on the Tuolumne River in what is now Yosemite National Park.

Construction before 1929 naturally involved mules and a great deal of hand labor as well as mechanical equipment. Work on Emerald Lake Dam No. 1 in San Mateo County in October 1926 utilized a Fordson tractor to drag-down the embankment slope prior to rolling. Note the men in the background doing shovel work. In the next photograph, an air compressor stands in the foreground during construction of Santiago Creek Dam in Orange County. This shot, taken in July 1931, shows foundation cleaning being performed by men with shovels and mules pulling drags.

The photograph above shows another view of equipment utilized in the construction of Santiago Creek Dam.

Many earthfill dams constructed in the early 1900s were built using hydraulic-fill methods, whereby soils were sluiced into place using hydraulic nozzles or flumes. San Pablo Dam in Contra Costa County was originally constructed by this method, as illustrated in the photograph below. The hydraulic-fill area is shown in the far right of the photo between the flume sections.

The failure of St. Francis Dam in Southern California shortly before midnight on March 12, 1928, resulted in loss of life nearly as great as that sustained in the great San Francisco Earthquake and Fire of 1906. The flood released by the precipitous failure of the dam, located on a little known tributary of the Santa Clara River, moved in early morning darkness and with little or no warning through the communities of Saugus, Castaic Junction, Piru, Fillmore, Santa Paula, and Ventura in its rush to the sea. When the flood had passed and daylight returned, between 400 and 450 people had been killed, hundreds of homes had been destroyed, and some 8,000 acres of crops had been lost. In 1928 dollars, the property destruction was estimated at between 12 and 15 million.

A few days after the tragedy, the coroner's jury, meeting in Los Angeles, concluded that the planning, design, and construction of a great dam "should never be left to the sole judgment of one man, no matter how eminent, without checks by independent expert authority, for no one is free from error".

The following year the California Legislature provided the State with authority, with police power, to oversee the design, construction, and maintenance of dams of a jurisdictional size--the first such program in the nation. The effective date of this legislation was August 14, 1929. This first program was to be administered under the Department of Public Works and would be headed by George W. Hawley. Hawley directed the dam safety program until 1942.

State consulting boards were established to review dams where there was a question regarding safety. The group shown below was involved in a review of San Gabriel No. 1 Dam in Los Angeles County. The photograph was taken in early 1935 and included from the left, Chester Marliave, George W. Hawley, F. C. Herrmann, C. D. Marx, and William H. Holmes who was to replace Hawley as head of the dam safety program in 1942.

Over the years, the dam safety staff has become involved in all aspects of dam design, construction, and maintenance. Dam safety engineers review preliminary designs as well as inspect sites for proposed dams. They check the construction plans and specifications in detail before approving construction applications, and all construction is closely inspected in the field. They also observe the initial filling of the reservoir to ensure that the facilities perform safely. Regular inspections of the operating structure and appurtenant facilities continue for the life of the jurisdictional size dam and reservoir.

In 1952 Walter A. Brown took the reins as the Division Engineer. During his tenure in the position, the Department of Water Resources was created to oversee the development of water-related facilities and dam safety within the State.

In 1963 Baldwin Hills Dam in Los Angeles County failed. The empty reservoir shown above was an "offstream storage facility". As a result of this failure additional legislation was enacted two years later to provide for jurisdiction over offstream storage facilities and over the entire reservoir, as well as the dam.

Robert B. Jansen became the Division Engineer in 1964 followed by Clifford J. Cortright in 1968.

Dam construction in the 1960s and 1970s involved some very large mechanical equipment, as is evidenced by the bucket loader used at Oroville Dam and the sheepsfoot rollers and the carryall used at New Lake Arrowhead Dam.

But there is still a need for hand labor, as illustrated in the concrete placement for a new spillway at Rancho Del Ciervo Dam above. The photograph below gives a view of the embankment being placed at San Pablo Dam using several different kinds of equipment:

The Division's program has expanded to include review of Federal Government projects such as New Melones, Warm Springs, and the proposed Auburn Dam. The Division participates in the National Dam Inspection Program, by contract with the U. S. Army Corps of Engineers for review of nonfederal dams in the State having "high downstream hazard" potential.

Gordon W. Dukleth became the Division Engineer in 1973, and Herbert W. Greydanus took over in 1977. The present Chief of the Division of Safety of Dams is James J. Doody, who was appointed to the position in March 1978.

The Division of Safety of Dams has an aggressive program for keeping current with the state-of-the-art in dam design, construction, and analysis. The Division applies finite element methods and other numerical and computer techniques to perform static and dynamic earthquake analyses on both earthfill and concrete dams. The staff members keep up-to-date with the technical literature, exchange information with other professionals in the field, and regularly participate in conferences and seminars to maintain their capabilities.

The United States Committee on Large Dams Model Law of 1970 is based largely upon California experience and offers a framework from which individual states can enact dam safety legislation. It is not surprising that some features of the California program have since become included in the procedures of other programs, and in the 1972 National Dam Inspection Program.

EXPLANATION OF TABULATED DATA

This bulletin includes the name of dam, ownership, county, stream, location, type, size, water storage capacity, and age of each dam. All units of measure are given in the International System (S.I.) and the English System. Column headings introduce the data as indicated below.

Name of Dam as assigned by owner on original application, or as changed by owner in subsequent written correspondence to the Department.

Dam Number as assigned by the Department of Water Resources.

Name of Owner as it appears on application.

County in which dam is located.

Stream on which dam is located as named by the owner on original application or as revised to conform with USGS topographic maps.

Location is section, township, range, and base line and/or meridian, as used in "The System of Rectangular Surveys." Also included are latitude and longitude of the center point of the dam.

Type of main dam only.

Unit for dimensions of each item, first in S.I. or metric, then the equivalent unit in the English System.

Storage Capacity in decametres, then acre-feet, including dead storage.

Drainage Area in square kilometres and square miles.

Reservoir Area in square hectometres or acres at spillway crest elevation or, if headwater controls are used, at the maximum water storage elevation.

Crest Elevation in metres and feet (USGS datum, when available; otherwise approximate USGS datum).

Crest Length of the main dam (excluding auxiliary dams) in metres and feet.

Height in metres and feet from dam crest elevation (excluding any parapet) to the lowest elevation of the outside limit of the dam.

Total Freeboard is the vertical distance in metres and feet from the dam crest to the lowest point of the spillway control section (excluding flashboards and gates).

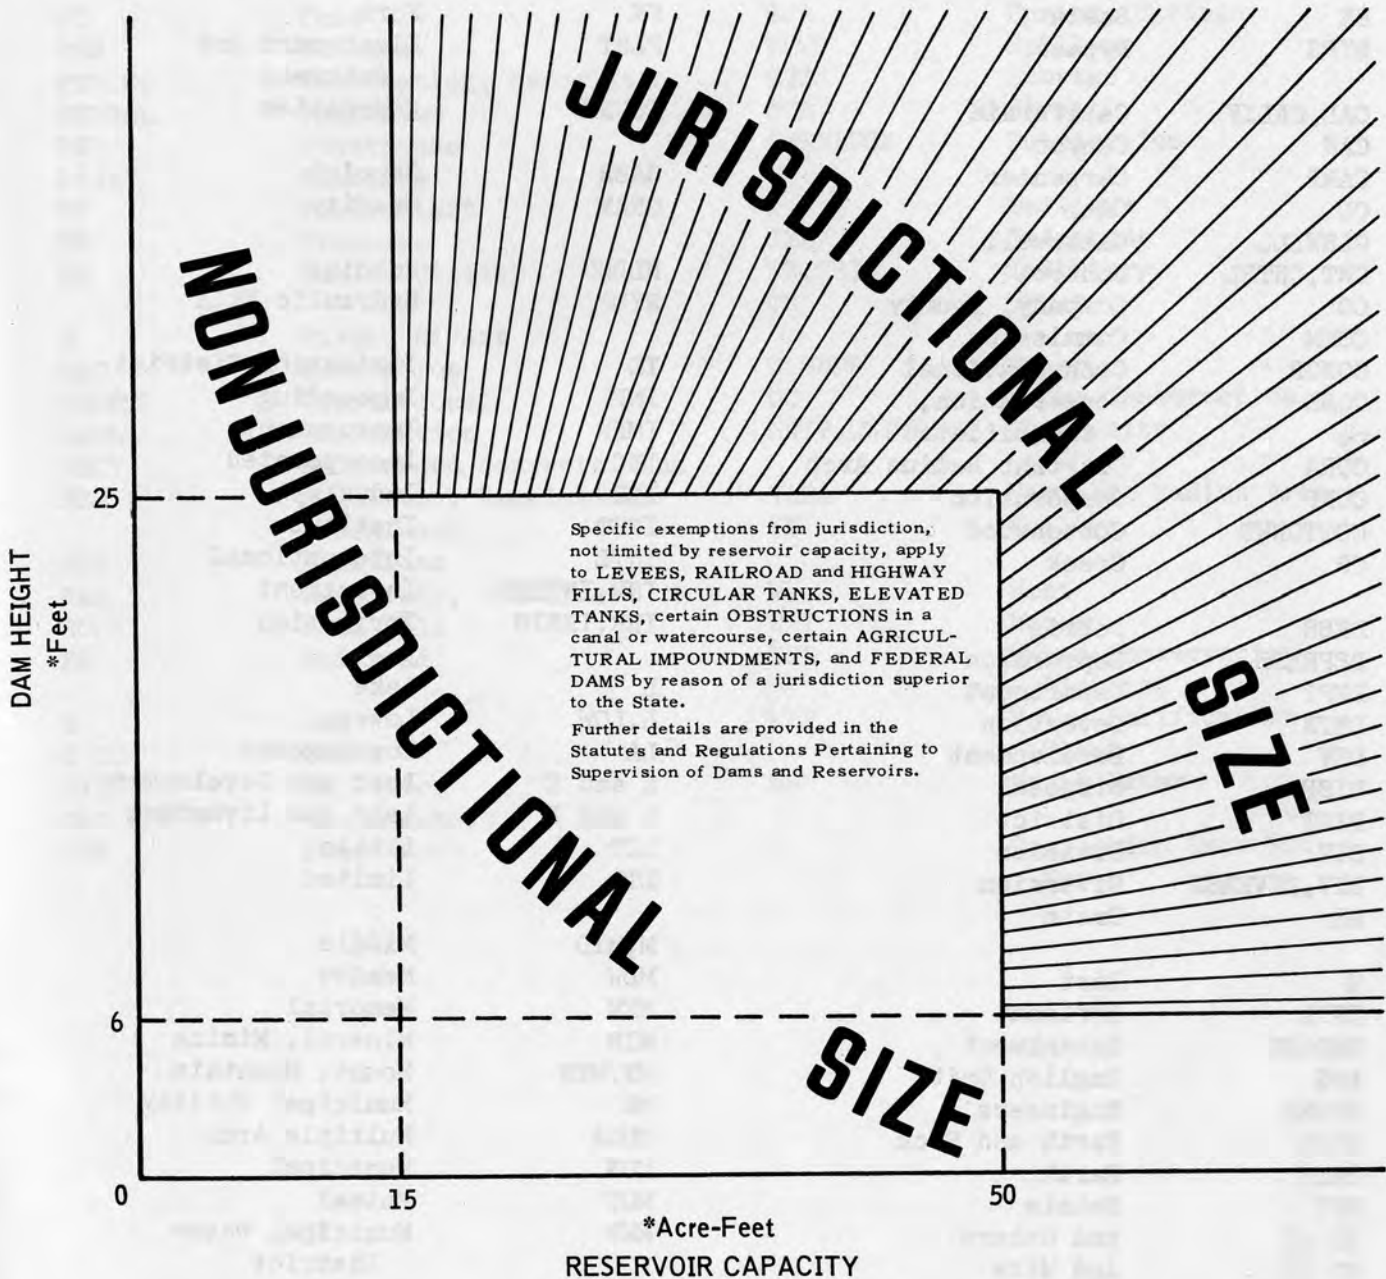

Operating Freeboard, where spillway crest controls are used, the vertical distance in metres and feet from the dam crest to the maximum possible water storage elevation (top of gates or flashboards).

Crest Width in metres and feet to the axis at the narrowest point.

Dam Volume in cubic metres and cubic yards of the principal material used for both main and auxiliary dams.

Year Completed is date the original construction was completed.

PROVISIONS OF DIVISION 3 OF THE CALIFORNIA WATER CODE
AFFECTING JURISDICTION OVER DAMS AND RESERVOIRS

*Metric units not specified in the Water Code are:
 1.83 metres = 6 feet 18.50 megalitres = 15 acre-feet
 7.62 metres = 25 feet 61.68 megalitres = 50 acre-feet

CONVERSION FACTORS

Metric to Customary System of Measurement

<u>Quantity</u>	<u>Metric Unit</u>	<u>Multiply by</u>	<u>To get customary equivalent</u>
Length	millimetres (mm)	0.03937	inches (in)
	centimetres (cm) for snow depth	0.3937	inches (in)
	metres (m)	3.2808	feet (ft)
	kilometres (km)	0.62139	miles (m)
Area	square millimetres (mm ²)	0.00155	square inches (in ²)
	square metres (m ²)	10.764	square feet (ft ²)
	hectares (ha)	2.4710	acres (ac)
	square kilometres (km ²)	0.3861	square miles (mi ²)
Volume	litres (l)	0.26417	gallons (gal)
	megalitres	0.26417	million gallons (10 ⁶ gal)
	cubic metres (m ³)	35.315	cubic feet (ft ³)
	cubic metres (m ³)	1.308	cubic yards (yd ³)
	cubic metres (m ³)	0.0008107	acre-feet (ac-ft)
	cubic dekametres (dam ³)	0.8107	acre-feet (ac-ft)
	cubic hectometres (hm ³)	0.8107	thousands of acre-feet
Flow	cubic kilometres (km ³)	0.8107	millions of acre-feet
	cubic metres per second (m ³ /s)	35.315	cubic feet per second (ft ³ /s)
	litres per minute (l/min)	0.26417	gallons per minute (gal/min)
	litres per day (l/day)	0.26417	gallons per day (gal/day)
	megalitres per day (MI/day)	0.26417	million gallons per day (mgd)
Mass	cubic metres per day (m ³ /day)	0.0008107	acre-feet per day
	kilograms (kg)	2.2046	pounds (lb)
Velocity	tonne (t)	1.1023	tons (short, 2,000 lb)
	metres per second (m/s)	3.2808	feet per second (ft/s)
Power	kilowatts (kW)	1.3405	horsepower (hp)
Pressure	kilopascals (kPa)	0.145054	pounds per square inch (psi)
	kilopascals (kPa)	0.33456	feet head of water
Specific capacity	litres per minute per metre drawdown	0.08052	gallons per minute per foot drawdown
Concentration	milligrams per litre (mg/l)	1.0	parts per million
Electrical conductivity	microsiemens per centimetre (μ S/cm)	1.0	micromho per centimetre
Temperature	degrees Celsius (°C)	(1.8 × °C) + 32	degree Fahrenheit (°F)

CONVERSION FACTORS

Metric to Customary System of Measurement

<u>Quantity</u>	<u>Metric Unit</u>	<u>Multiply by</u>	<u>To get customary equivalent</u>
Length	millimetres (mm)	0.03937	inches (in)
	centimetres (cm) for snow depth	0.3937	inches (in)
	metres (m)	3.2808	feet (ft)
	kilometres (km)	0.62139	miles (m)
Area	square millimetres (mm ²)	0.00155	square inches (in ²)
	square metres (m ²)	10.764	square feet (ft ²)
	hectares (ha)	2.4710	acres (ac)
	square kilometres (km ²)	0.3861	square miles (mi ²)
Volume	litres (l)	0.26417	gallons (gal)
	megalitres	0.26417	million gallons (10 ⁶ gal)
	cubic metres (m ³)	35.315	cubic feet (ft ³)
	cubic metres (m ³)	1.308	cubic yards (yd ³)
	cubic metres (m ³)	0.0008107	acre-feet (ac-ft)
	cubic dekametres (dam ³)	0.8107	acre-feet (ac-ft)
	cubic hectometres (hm ³)	0.8107	thousands of acre-feet
Flow	cubic kilometres (km ³)	0.8107	millions of acre-feet
	cubic metres per second (m ³ /s)	35.315	cubic feet per second (ft ³ /s)
	litres per minute (l/min)	0.26417	gallons per minute (gal/min)
	litres per day (l/day)	0.26417	gallons per day (gal/day)
	megalitres per day (MI/day)	0.26417	million gallons per day (mgd)
Mass	cubic metres per day (m ³ /day)	0.0008107	acre-feet per day
	kilograms (kg)	2.2046	pounds (lb)
Velocity	tonne (t)	1.1023	tons (short, 2,000 lb)
	metres per second (m/s)	3.2808	feet per second (ft/s)
Power	kilowatts (kW)	1.3405	horsepower (hp)
Pressure	kilopascals (kPa)	0.145054	pounds per square inch (psi)
	kilopascals (kPa)	0.33456	feet head of water
Specific capacity	litres per minute per metre drawdown	0.08052	gallons per minute per foot drawdown
Concentration	milligrams per litre (mg/l)	1.0	parts per million
Electrical conductivity	microsiemens per centimetre (μS/cm)	1.0	micromho per centimetre
Temperature	degrees Celsius (°C)	(1.8 × °C) + 32	degree Fahrenheit (°F)
