ACKNOWLEDGMENT

In the conduct of the investigations of the Sacramento-San Joaquin Water Supervisor, much valuable assistance has been rendered by many individuals and public and private agencies.

Land owners and water users and the executives, engineers, managers, and water superintendents of the various water organizations throughout the territory covered by this work have cooperated fully in furnishing the many and varied data requested.

For the compilation of pumped diversions the Pacific Gas and Electric Company, San Joaquin Light and Power Corporation and Modesto and Turlock Irrigation Districts have furnished a large number of power consumption records.

Valuable cooperation extended by Federal agencies has included that of the Water Resources Branch of the Geological Survey, U. S. Department of Interior; the Division of Irrigation of the Bureau of Agricultural Engineering, U. S. Department of Agriculture; and the Sacramento District Engineer Office, South Pacific Division, Corps of Army Engineers, U. S. War Department.

The State Division of Highways has cooperated in the expeditious and efficient testing of salinity samples in its testing laboratory.

ADVISORY COMMITTEE

PERMANENT COMMITTEE OF THE SACRAMENTO-SAN JOAQUIN RIVER PROBLEMS CONFERENCE

This Committee, representing the water users and other interests involved, was appointed by the First Sacramento-San Joaquin River Problems Conference in January, 1924. Its continued interest and cooperation and particular activity in the promulgation of effective conservation measures in the seasons of critical water supply have contributed in large measure to the successful prosecution of the Water Supervisor Work.

CHAPTER I

INTRODUCTION

The purpose of this report is to make of record the measurements made and data collected through the office of the Sacramento-San Joaquin Water Supervisor during the years 1933 and 1934.

Origin and History of Work

This work was inaugurated in 1924 through the efforts of the first Sacramento-San Joaquin River Problems Conference and its Permanent Committee working with the former Division of Water Rights. A complete description of the origin, history and conduct of this work will be found in the 1924 and 1926 Bienniel Reports of the former Division of Water Rights, in Bulletin Number 4 of the same Division, and in Bulletin Number 23 of the Division of Water Resources. Tne latter Bulletin brings together all data and measurements obtained by the Water Supervisor in the five year period, 1924 to 1928, inclusive. The reports for subsequent years are mimeographed as the present report.

Objectives and Scope

The work of this office is a measure of relief in the difficulties attendant upon water supply conditions and tne use of water throughout the Sacramento-San Joaquin territory, particularly on the Sacramento River and in tne Delta Region. The situation involves the major problem of satisfying the water requirements for irrigation in both tne Up-River areas and the Delta, for the control of salinity in the Delta and Upper Bay areas, and for navigation above Sacramento as demanded by the U. S. War Department, when, in nearly every season of the last eleven years, each one of these

requirements has exceeded the available Summer flow in the rivers. Pending ultimate relief through the development of reservoir storage this situation has been met through a provisional administration of stream flow and diversions, by the Sacramento-San Joaquin Water Supervisor. There has been no adjudication of the water rights under which a water master might definitely and equitably distribute the existing water supply to those entitled to receive it but it seems inevitable that such an adjudication, or a definite schedule of water priorities consummated possibly by mutual agreement, must be developed. Its realization will require however that there shall be available reliable and accurate data over a long period of years covering all of the actual diversions and uses of water, the stream flow, return flow, salinity, and all pertinent hydrographic data. Looking to this requirement, then, the Water Supervisor is, concurrently with the provisional stream administration, conducting the investigations and all measurements necessary to complete the record of basic data.

In the seasons of severe or extreme water shortage such as 1924, 1926, 1931, and 1934 the Water Supervisor working in cooperation with the Permanent Committee of the Sacramento-San Joaquin River Problems Conference, has been able to effect conservation measures and regulation which have been highly successful in tiding over the critical situations of these seasons. Up-River areas are patrolled and waste eliminated, close check is kept of river flow, diversions and the advance of salinity into the Delta, and when salinity of dangerous degree threatens, bulletins giving the results of all tests throughout the Delta are given to the water users at weekly or shorter intervals. With deficient stream flow there has been always imminent the threat of conflict between "Up-River" and Delta inter-

the Bureau of Agricultural Engineering; U. S. Department of Agriculture; an annual census of irrigated acreages and crops under all diversions recorded; and observations and investigation of the advance and retreat of salinity in the Delta channels and Upper Bays. In the last two seasons it has been necessary to omit the census of irrigated crops and water consuming areas in the Delta, as conducted in previous years.

State and Water Users' Cooperative Financing

When the Water Supervisor work was initiated in 1924, the water users and other interests concerned raised the money for the first year by subscription to the extent of about $17,000. However, at the 1925 Legislative Session, the Permanent Committee of the Sacramento-San Joaquin River Problems Conference made the plea that due to the widespread character of the work and importance to the public generally, it should, properly, be carried by the State. As a result, provision for continuing this work was made in the budget of what was then the Division of Water Rights and subsequently the Division of Water Resources. This held until June 30, 1933, with an annual expenditure for the work amounting to about $23,000.

With the drastic reduction in budgets at the 1933 Legislative Session, provision for the Water Supervisor work was entirely eliminated from the Division of Water Resources' budget. On June 30, 1933, therefore, this work was entirely suspended. Because a complete cessation of the work meant an irreparable loss in the records as well as probable reversion to the former conditions of litigation and conflict in the utilization of Sacramento River waters, the Permanent Committee of the Sacramento-San Joaquin River Problems Conference appeared before the Governor and Director

ests and of drastic action by the War Department to enjoin irrigation diversions in the maintenance of navigation with which it is charged. But in the evidence by the water users of their desire to cooperate and to work with the Water Supervisor for utmost conservation, the War Department has been constrained to waive severe action and to assume a course taking cognizance of the needs of irrigation; and the fact that actual conflict and disastrous litigation between Up-River and Delta interests have not developed may, in a large measure, be attributed to the part which the State is taking through the Division of Water Resources and the Water Supervisor in bringing the water users together, in making such adjustments and effecting such measures as the situation will permit and in pursuing the investigation of the facts necessary to a permanent solution of the difficulties.

Investigational Work

During the past biennium the investigational work has, due to financial limitations, continued under a considerably reduced program but along lines similar to those of previous years, and has comprised: measurements and records of the diversions of water from the Sacramento, Feather, Yuba, American, Merced, Tuolumne, Stanislaus, and San Joaquin rivers on the valley floor and above the Delta; stream flow measurements throughout the territory, largely in cooperation with the Water Resources Branch of the U. S. Geological Survey; measurements and records of waters returned to the Sacramento and San Joaquin rivers; some further studies (closed at the end of the 1933 season) of the consumptive use of water in the Sacramento-San Joaquin Delta in cooperation with the Division of Irrigation of

there were provided therefore, sufficient funds to complete the 1934 field work and the compilation and publication of the 1933 and 1934 reports.

Conservation Features and the 1934 Water Shortage

A comparison of the run-off and water supply conditions of the 1933 and 1934 seasons with those of previous seasons in which the work of the Water Supervisor has been conducted, is indicated in Table 1.

TABLE 1

1932	78	2620	1530	1900	965	90700
1933	46	2620	1350	1340	569	87400
1934	40**	2400	1320	1050	315	91800

* Normal taken as 40-year mean (1889-1929) of natural run-off at foothill stations of major tributaries.

** Based on measured run-off - Natural flow was not compiled.

of Finance on August 10, 1933, to urge an appropriation from the State Emergency Fund to be matched by moneys to be raised by the water users; the total amount not to exceed that necessary to carry on the bare essentials only of the work. It was estimated that $12,500 annually would accomplish this and thereby prevent the greatly disproportionate loss which would be sustained with the work completely abandoned. The Emergency Fund allotment was granted on the condition that the water users would raise their proportionate share, and the work for the 1933 irrigation season was resumed. The Emergency Fund allotment was held up by reference to the Supreme Court and the decision of the latter which approved the allotment was not handed down until early March, 1934. Pending this decision, the Water Supervisor work had again been entirely suspended on November 1, 1933, at the close of the irrigation season, and the compilation of the 1933 report which would ordinarily have occurred during the Winter months was not made. With the Emergency Fund allotment assured, the Permanent Committee immediately began a campaign to secure the necessary subscriptions from the water users, and by the beginning of the 1934 irrigation season it appeared that a substantial amount of money would be raised from this source. Essential items of the work were, therefore, again resumed in April, 1934, and continued throughout the irrigation season. By the first of July 1934 the total subscriptions from the water users amounted to $5500. This was insufficient to match the Emergency Fund allotment but on account of the critical 1934 water supply and the resultant extreme importance of carrying on the water supervision, the Permanent Committee urged that the State should meet the emergency by making available the entire allotment from the Emergency Fund. This was done and

the Water Supervisor work, the water users had been informed of the pending water shortage and warned of the necessity of taking this into account in planning for the season. Later, letters were addressed to all water users advising of the control measures to be taken and urging the utmost conservation. A letter was also sent to the water users by the District Engineer for the U. S. War Department, advising that only through complete cooperation upon the part of the water users with the measures adopted by the Permanent Committee and the Division of Water Resources through the Water Supervisor, the reduction of diversions to the minimum actually necessary and the elimination of all wastage, would the War Department be constrained to forego drastic measures to reduce irrigation diversions in order to protect the interests of navigation. On all of the larger projects, Conservation Officers were appointed to cooperate with the Water Supervisor in the detection and prevention of waste and the rule was established to cut diversions by the amount of waste.

Throughout the critical period of July and August, detailed inspections of the use of water were made by the Water Supervisor's office in cooperation with the Conservation Officers and full cooperation was given by the water users to cut down waste and spill in order that the river diversions might be correspondingly reduced. By the latter part of July more than fifty stations had been established throughout the Delta to carry on regular sampling of the water for salinity testing and in the period from July to October, weekly bulletins giving the results of the tests were sent out to a list of more than two hundred Delta water users in order that they might be advised as to the encroachment of salinity dangerous to irrigation.

While the situation in the Sacramento-San Joaquin territory in the 1934 season was not as critical as that of 1931 when the lowest stream flow of record occurred, the requirement for a great deal of activity on the part of the Water Supervisor in the way of conservation and administration of the stream flow, was urgent. The previous season most similar to 1934 with respect to water supply conditions was 1924 and although the seasonal run-off in per cent of normal as shown in Table 1 was only 28 per cent in that year as compared to 40 per cent in 1934, it is to be noted that in the latter year the Sacramento River at Red Bluff reached the lowest flow of record, even lower than in 1931. Also the rice acreage served from the Sacramento River and its tributaries in 1934 exceeded that of 1924. Since rice is such a large consumer of water, the extent of the rice acreage is a considerable factor in the water supply situation. This is indicated in Table 1, where the variation of minimum river flow with seasonal run-off in per cent of normal clearly requires the additional explanation offered by the rice acreage figures. The minimum river flow at Red Bluff appears to reflect the cumulative effect of many dry seasons and with the succession of subnormal years since 1927, its steady and material decline is very marked.

By April 1934, it was clearly evident that a drastic program of conservation and river administration would be necessary, and at two meetings of the Permanent Committee of the Sacramento-San Joaquin River Problems Conference and representatives of the Division of Water Resources and the U. S. War Department, held in the latter part of April, plans were made to carry out such a program. In connection with previous letters sent out by the Permanent Committee soliciting subscriptions to carry on

CHAPTER II

MEASUREMENTS OF STREAM FLOW

During the irrigation seasons of 1933 and 1934, stream flow measurements and records were obtained through cooperation with the Water Resources Branch of the U. S. Geological Survey, for stations on the Sacramento River at Kennett, Red Bluff, Butte City, Colusa, Wilkins Slough, Knights Landing, and Verona; on the Feather River at Nicolaus; on the American River at H Street Bridge, Sacramento; on the Mokelumne River at Woodbridge, and on the San Joaquin River near Newman and Vernalis.

Supplementing the above cooperative stations, the Water Supervisor maintained stations on Lower Butte Creek and Slough, and in connection with the San Joaquin return water measurements (See Chapter IV), stations as follows: Stanislaus River at Orange Blossom Bridge and Hatmark Ranch, Tuolumne River at Roberts Ferry Bridge, Hickman Bridge and Tuolumne City Bridge, Merced River at Yosemite Valley Railroad Crossing and Hills Ferry Road Bridge (near mouth), Dry Creek at Basso Ranch (near Modesto), and San Joaquin River at Delta Bridge, Fremont Bridge and Grayson (Laird Slough). In addition, many stations maintained on by-pass and drainage channels for the measurement of return water are listed in Chapter IV.

The stations at Kennett, Red Bluff, Verona, Woodbridge, Vernalis, and Newman are maintained throughout the year but the records are given in this report for the irrigation season only.

Sacramento River at Sacramento

The record of the flow of the Sacramento River at Sacramento as given in this and previous reports, does not represent actual measurements

With the close of the season the records showed an encroachment of salinity into the Delta corresponding very closely to but not quite as far reaching as that of 1924, and the minimum combined flow to the Delta of the Sacramento and San Joaquin rivers exceeded that of 1924 by 300 second-feet. Faced with these facts and a probable crop loss due to salinity in the Delta, nearly as great as that of 1924, it may seem that little was accomplished by the strenuous efforts put forth. When viewed, however, from the standpoint of what the situation might have been without these efforts, with no recognition by the water users of the need for conservation and no concerted action for waste prevention, the results are more encouraging. In the evidence by the water users of their desire to cooperate and to put forth every possible effort to conserve water the War Department was constrained to waive severe action in the protection of navigation with which it is charged and was supported in assuming a course which took cognizance of the needs of irrigation. Likewise in the getting together of the water users on this cooperative endeavor, there was the very material benefit in the deterrent to and prevention of expensive and widespread litigation.

NOTE: This is a permanent station maintained throughout the year under Federal-State cooperation by the Water Resources Branch of the U. S. Geological Survey. The record is given here for the period of the irrigation season only.

at a station below the City of Sacramento Intake. Because of tidal action, a gaging station at this point is not feasible. The daily discharge record as given has been computed by using the Verona record and making due allowance for the measured inflow and draft between that station and Sacramento. In this computation it is not practicable and no attempt has been made to allow for the time required for the flow to travel from Verona to Sacramento and to make the various deductions and additions enroute at the exact time that the given Verona flow would have passed the respective points of inflow or draft. During the Summer period the velocities between Verona and Sacramento are low and a given flow may require a day's time or more to travel this distance. Under these conditions, the computed flow at Sacramento may differ somewhat from what would have been found if the actual flow could have been measured. Contributing to this difference also there are the accretions or losses which cannot be measured. In the upper sections of the river the invisible accretions or losses between two points are susceptible of computation as the remaining quantity required to satisfy the equation when the flow at the upper and lower points and all definite intermediate inflows and drafts are known. With no actual measurement of the flow at Sacramento, the invisible accretions or losses between Verona and Sacramento cannot be thus defined and hence they are unaccounted for in the computed flow at Sacramento. From the data presented subsequently in Chapter IV, it would appear that some return flow might be expected in the Verona-Sacramento section but, as indicated in the tabulation of return water (Tables 88 and 90) no figure for it has been given (except for the measured drains because it could not be derived without a record of the actual flow at Sacramento.

NOTE: This is a permanent station maintained throughout the year under Federal-State cooperation by the Water Resources Branch of the U. S. Geological Survey. It is located at Mile 19.6 above Sacramento at the mouth of "Cross Canal" main drain of Reclamation District 1001, and below the mouth of the Feather River. The record is given here for the period of the irrigation season only.

NOTE: This represents the flow past Sacramento (below the City of Sacramento intake) to the Delta. The discharges of this table have been computed by adding to the measured Verona discharges the measured inflow of return water and American River and subtracting therefrom the measured diversions between Verona and Sacramento. A gaging station is not maintained at Sacramento because of tidal action.

* In the period from July 8th to October 20th the continuous water stage record was lost due to temporary discontinuance of Water Supervisor work. The discharge in this period has been estimated by comparison with the flow at Fairoaks, and from weekly gage readings and bi-weekly measurements.

NOTE: This station is maintained seasonally under Federal-State cooperation by the Water Resources Branch of the U. S. Geological Survey. It is located at H Street Bridge, Sacramento, 6.0 miles above the mouth of the river.

NOTE: This is a staff gage station at the county road bridge East of Los Banos, Mile 82.0 above Durham Ferry Bridge. Intermittent gage readings. This station has been referred to previously as "San Luis Island" or "Turner Ranch Bridge". Prior to the time all river flow is diverted above this station, ordinarily in early July, there may be considerable river flow which by-passes the station via Pick Anderson and Salt Sloughs.

In 1934 there was no flow at this station in the period from the first observation on May 25th to October 31st.

* Beginning of record for season.
** 2 days.

TABLE 25

DISCHARGE OF SAN JOAQUIN RIVER AT FREMONT BRIDGE-1934

No continuous record of discharge

Miscellaneous Measurements as follows:

Date	Gage Height Feet	Discharge Second-feet
8/31/34	58.27	6.4
9/26/34	58.21	5.6
10/31/34	58.27	5.2

NOTE: This is a staff gage station at the county bridge on the road between Gustine and Stevinson, Mile 52.8 above Durham Ferry Bridge and 5.7 miles above the mouth of the Merced River.

CHAPTER III

MEASUREMENTS OF DIVERSIONS

Measurements and records of diversions in 1933 and 1934 have included those from the Sacramento River and its tributaries on the valley floor, those to the Delta Uplands from Cache Slough, Old San Joaquin River, Tom Paine Slough, and San Joaquin River, and those on the Stanislaus, Tuolumne, Merced, and San Joaquin Rivers as obtained in connection with the return water measurements (See Chapter IV). For 1934 this report records a total of 461 diversions, segregated to the various sources as follows: Sacramento River 204, Colusa Trough 2, Back Borrow Pit (carrying drainage water from Colusa Basin along the back levees of Reclamation Districts 108 and 787) 8, Lower Butte Creek and Butte Slough 15, By-pass and Drainage Channels 22, Feather River 37, Yuba River 10, American River 24, diversions to Delta Uplands from Cache Slough 1, from Old San Joaquin River 12, from Tom Paine Slough 8, and from San Joaquin River (below Vernalis gaging station) 34, San Joaquin River (above Vernalis Gage) 15, Stanislaus River 14, Tuolumne River 10, and Merced River 45.

All of these diversions except five are accomplished by pumping. The five exceptions are gravity diversions, two on the Yuba River, two on the Feather River and one on the Sacramento River, and the records for these are obtained by means of canal ratings. In the case of the pumping diversions there are a few instances where the records are obtained by means of canal ratings but in the main the records are obtained from the relation established between electric power consumption and pump discharge. This is possible due to the fact that nearly all of the

pumping plants are electrically operated. At a relatively small number of pumps operated by other power, daily operation records are kept. Prior to 1933 all pump operators kept daily operation records on blanks furnished by the Water Supervisor. These records were collected monthly by the field engineers at the same time that the readings of the electric meters were recorded. Under the reduced program necessitated in the last two seasons, only the larger plants have kept the daily operation records and the power consumption data have been secured from the power distributing agency in lieu of monthly meter readings by the field engineers. The relation between power input and water pumped is determined from current meter measurements of the discharge. At the larger pumping plants several measurements are made during each season. At the smaller plants a sufficient number of measurements are made initially to determine the rating and thereafter at intervals sufficient to show any changes which may occur in the rating. With the daily operation records available prior to 1933 it was possible to compile from the monthly diversions as computed from the power record, a daily diversion record for each plant, and this was done. However, for 1933 and 1934, except for the larger diversions, the monthly records only are available.

Summaries of the 1933 and 1934 diversions throughout the Sacramento-San Joaquin territory are shown in Tables 48 and 49. A segregation is made to show the relative diversions from the various river sources. For each segreation the tables show also the acreage irrigated and the computed seasonal gross duty of water.

* MILEAGE ALONG RIVER ABOVE SACRAMENTO.
(1) THIS DIVERSION WAS SUPPLEMENTAL TO GRAVITY DIVERSION FROM BUTTE CREEK FOR THE SAME ACREAGE.
(2) ALL ON PARROTT RANCH.
(3) FORMERLY P. M. ROONEY.
(4) PUMP ON NORD SLOUGH OR PINE CREEK LAGOON WHICH JOINS SACRAMENTO RIVER AT MILE 147.0 LEFT. PLANT IS LOCATED THREE MILES UP SLOUGH ON RIGHT BANK OR OPPOSITE MILE 150.0 LEFT, SACRAMENTO RIVER.
(5) TWO NEW UNITS INSTALLED IN 1933 REPLACING OLD 12" AND 18" PUMPS.
(6) THIS IS A COMMON POINT OF DIVERSION FOR THE GLENN–COLUSA, JACINTO, COMPTON–DELEVAN, PROVIDENT, PRINCETON–CODORA–GLENN AND MAXWELL IRRIGATION DISTRICTS.
(7) INCLUDES GRAVITY DIVERSION: (ACRE-FEET) MARCH 1650, APRIL 1700. DIVERSION IN NOVEMBER WAS 9350 ACRE-FEET. ADDITIONAL WATER WAS OBTAINED BY GRAVITY FROM STONEY CREEK AS FOLLOWS: (ACRE-FEET) MARCH 400, APRIL 240. THE DIVERSION SHOWN INCLUDES WATER FOR C. L. LEONARD (OUTSIDE DISTRICT) AS FOLLOWS: (ACRE-FEET) MAY 110, JUNE 140, JULY 86, AUGUST 14, SEPTEMBER 27, OCTOBER 35, TOTAL 412.
(8) INCLUDES 157 ACRES OF C. L. LEONARD (OUTSIDE DISTRICT) AND 724 ACRES DUCK PONDS.
(9) SAME PLANT AS THAT OF GLENN–COLUSA IRRIGATION DISTRICT.
(10) INCLUDES 83 ACRES SERVED FOR PROVIDENT IRRIGATION DISTRICT.
(11) INCLUDES 825 ACRES DUCK PONDS.
(12) SEE ACREAGE NOTE FOR JACINTO IRRIGATION DISTRICT, MILE 154.8 R.
(13) INCLUDES 811 ACRES SERVED FOR PRINCETON–CODORA–GLENN IRRIGATION DISTRICT AND 354 ACRES IRRIGATED FROM HUNTER CREEK (INTERIOR DRAIN) PUMP.
(14) 811 ACRES ADDITIONAL, INCLUDING 229 ACRES ON HENRY JAMESON PROPERTY (COLUSA TROUGH DIVERSIONS, MILE 22.0 R) WERE IRRIGATED FOR PRINCETON CODORA–GLENN IRRIGATION DISTRICT THROUGH PROVIDENT IRRIGATION DISTRICT SYSTEM.
(15) ALL DUCK CLUBS.
(16) FORMERLY HAMMON STOCK RANCHES.

(5) INCLUDES ADJOINING ACREAGE AS FOLLOWS: LUNDBLAD 10, McDEVITT 12.
(6) FORMERLY HASKINS BROTHERS.
(7) FORMERLY H. W. JOHNSON, JR.
(8) INCLUDES 20 ACRES ON ADJOINING HENDERSON PROPERTY.
(9) RETURN WATER FROM THIS DIVERSION REACHES THE SACRAMENTO RIVER AS SEEPAGE OR DIRECT SPILL IN THE DRAINS AND CREEK CHANNELS BETWEEN REDDING AND SOUTH OF COTTONWOOD.
(10) DISTRICT SUPERINTENDENT ESTIMATED 1933 ACREAGE TO BE SAME AS IN 1932. AS NOTED IN 1932 THIS FIGURE WAS DERIVED FROM A DETAILED SURVEY AND INCLUDES 11859 ACRES ACTUALLY CROPPED AND SURFACE IRRIGATED AND 300 ACRES WHICH RECEIVED BENEFIT THROUGH SUB-IRRIGATION.
(11) IT IS ESTIMATED THAT AT LEAST ONE-HALF OF THIS DIVERSION IS RETURNED DIRECTLY TO THE RIVER.

* MILEAGE ALONG RIVER ABOVE SACRAMENTO.

(1) NEW INSTALLATION 1934.

(2) THERE WAS PRACTICALLY NO FLOW DURING THE IRRIGATION SEASON IN DISTRICT 1000 DRAIN WHICH DISCHARGES TO THE SUMP OF ONE OF THE UNITS OF THIS PUMPING PLANT. WHATEVER SMALL DRAINAGE FLOW MAY HAVE OCCURRED WAS PUMPED TO THE IRRIGATION CANAL AND IS INCLUDED IN THE DIVERSION HERE SHOWN.

(3) INCLUDES 68 ACRES ON ADJOINING H. T. SILVIUS PROPERTY (MILE 16.4 R).

(4) SEE NOTE FOR FISHER AND RICH PLANT, MILE 16.27 R.

(5) ON ADJOINING PROPERTIES: ROSE, 27 ACRES; T. J. COX ESTATE (MILE 16.7 R) 20 ACRES.

(6) OLD 16" UNIT REPLACED IN 1934.

(7) 20 ACRES ADDITIONAL SERVED FROM PLANT AT MILE 16.62 R.

(8) SEE NOTE FOR FISHER AND RICH PLANT, MILE 22.5 R.

(9) CROSS CANAL, THE MAIN DRAIN BETWEEN R. D. 1000 AND 1001 JOINS SACRAMENTO RIVER AT MILE 19.6 L. IN 1934 THE FORMER DAM AND BOOSTER PLANT AT THE MOUTH OF CROSS CANAL WERE REMOVED, RIVER WATER REACHING CROSS CANAL PUMPING PLANTS BY GRAVITY. A NEW PUMPING INSTALLATION FOR IRRIGATION OF R.D. 1001 LANDS WAS MADE AT R.D. 1001 DRAINAGE PLANT AT MILE 0.75 CROSS CANAL (NORTH BANK) AND THE FORMER PUMPING PLANT OF NORTHERN MUTUAL WATER CO. AT MILE 4.0 CROSS CANAL (SOUTH BANK) WAS REPLACED BY A NEW INSTALLATION AT MILE 1.0 CROSS CANAL (SOUTH BANK).

(10) INCLUDES 50 ACRES OF CALIFORNIA WESTERN STATES LIFE INSURANCE COMPANY, MILE 17.75 R.

(11) ON GRAY'S BEND (OLD CHANNEL NOW CUT OFF).

* MILEAGE ALONG RIVER ABOVE SACRAMENTO.

(1) FORMERLY JOHN KOLPIEN.

(2) 5" UNIT ADDED IN 1934.

(3) ADDITIONAL WATER FOR RICE RECEIVED FROM R. L. YOUNG PLANT AT MILE 62.8 L.

(4) THIS DIVERSION USED FOR ACREAGE REPORTED UNDER THE PLANT AT MILE 62.3 L.

(5) INCLUDES WATER DELIVERED TO IMPROVEMENT MUTUAL WATER COMPANY AS FOLLOWS: (ACRE-FEET). APRIL 86, MAY 1376, JUNE 1048, JULY 899, AUGUST 1284, SEPTEMBER 649. TOTAL 5342.

(6) THESE FIGURES GIVE THE TOTAL ACREAGE IRRIGATED FROM THE PORTUGUESE BEND, STATE RANCH BEND AND TISDALE PLANTS, MILES 32.0 L, 40.6 L, AND 63.75 L, RESPECTIVELY. THEY INCLUDE 2001 ACRES OF GENERAL CROPS IRRIGATED BY THE IMPROVEMENT MUTUAL WATER COMPANY (IN R. D. 1600) ENTIRELY FROM THE TISDALE PLANT.

(7) THIS IS THE TOTAL ACREAGE IRRIGATED BY THIS PLANT AND THAT AT MILE 67.1 L AND INCLUDES 157 ACRES OF D. A. WINSHIP (MILE 67.2 L) SERVED FROM PLANT AT MILE 67.1 L.

(8) FORMERLY D. L. W. HOFFMAN.

(9) 12" UNIT ADDED IN 1934.

(10) SEE ACREAGE NOTE FOR PLANT AT MILE 64.4 L.

(11) INCLUDES 8 ACRES OF SPRINGER ESTATE.

(12) INCLUDES ADJOINING ACREAGES AS FOLLOWS: SPRINGER ESTATE 8 ACRES; MERIDIAN FARMS COMPANY 9 ACRES IN RECLAMATION DISTRICT 1660 AND 82 ACRES IN RECLAMATION DISTRICT 70.

(1) FORMERLY HENRY GIANELLA.

(2) PUMP ON NORD SLOUGH OR PINE CREEK LAGOON WHICH JOINS SACRAMENTO RIVER AT MILE 147.0 LEFT. PLANT IS LOCATED THREE MILES UP SLOUGH ON RIGHT BANK OR OPPOSITE MILE 150.0 LEFT, SACRAMENTO RIVER.

(3) THIS IS A COMMON POINT OF DIVERSION FOR THE GLENN-COLUSA, JACINTO, COMPTON-DELEVAN, PROVIDENT, PRINCETON-CODORA-GLENN, AND MAXWELL IRRIGATION DISTRICTS.

(4) 2–66" VERTICAL UNITS NEWLY INSTALLED 1934.

(5) THERE WAS NO GRAVITY DIVERSION FROM THE RIVER IN 1934; 2911 ACRE-FEET ADDITIONAL WAS OBTAINED BY GRAVITY FROM STONEY CREEK IN APRIL; NOVEMBER DIVERSION FROM RIVER AMOUNTED TO 764 ACRE-FEET. THE DIVERSION SHOWN INCLUDES WATER FOR C. L. LEONARD AND I. G. ZUMWALT (OUTSIDE DISTRICT) AS FOLLOWS: (ACRE-FEET) LEONARD – APRIL 16, MAY 156, JUNE 71, JULY 59, SEPTEMBER 45, OCTOBER 61, TOTAL 408; ZUMWALT – APRIL 828, MAY 2271, JUNE 1378, JULY 1547, AUGUST 1429, SEPTEMBER 881, TOTAL 8334.

(6) INCLUDES 35 ACRES OF PROVIDENT IRRIGATION DISTRICT AND 78 ACRES OF C. L. LEONARD (OUTSIDE DISTRICT): INCLUDES ALSO 1054 ACRES DUCK PONDS.

(7) INCLUDES 388 ACRES OF PROVIDENT IRRIGATION DISTRICT AND 1358 ACRES OF I. G. ZUMWALT (OUTSIDE DISTRICT).

(8) SAME PLANT AS THAT OF GLENN-COLUSA IRRIGATION DISTRICT.

(9) INCLUDES 45 ACRES SERVED FOR PROVIDENT IRRIGATION DISTRICT.

(10) ADDITIONAL WATER OBTAINED FROM WILLOW CREEK (DRAIN) PUMP.

(11) 45 ACRES SERVED BY JACINTO IRRIGATION DISTRICT AND 35 ACRES BY GLENN-COLUSA IRRIGATION DISTRICT.

(12) INCLUDES 580 ACRES SERVED FOR PRINCETON-CODORA-GLENN IRRIGATION DISTRICT AND 423 ACRES IRRIGATED FROM HUNTER CREEK (INTERIOR DRAIN) PUMP. 388 ACRES ADDITIONAL WERE SERVED BY GLENN-COLUSA IRRIGATION DISTRICT.

(13) 580 ACRES ADDITIONAL WERE IRRIGATED FOR PRINCETON-CODORA-GLENN IRRIGATION DISTRICT THROUGH PROVIDENT IRRIGATION DISTRICT SYSTEM.

(14) ALL DUCK CLUBS.

(15) FORMERLY H. F. JACOBS.

* APPROXIMATE MILEAGE FROM JUNCTION WITH SACRAMENTO RIVER.

(1) ONLY DIVERSIONS WHICH OCCURRED PRIOR TO NOVEMBER 1ST ARE GIVEN FOR GUN CLUB ACREAGE. IN MOST INSTANCES THE DIVERSIONS FOR THIS PURPOSE EXTENDED INTO NOVEMBER AND DECEMBER.

(2) FORMERLY COLUSA DELTA FARMS COMPANY.

(3) 12" UNIT HAS BEEN REMOVED AND 20" UNIT REPLACED BY 24" UNIT FROM SACRAMENTO RIVER PLANT OF RECLAMATION DISTRICT 1004 (MILE 112.1 L).

(4) ADDITIONAL WATER RECEIVED BY GRAVITY DIVERSION AT MILE 9.3 R.

(5) ACREAGE DIVIDED BETWEEN CALIFORNIA LANDS, INC. (IN R.D. 1004) 1185 RICE AND 315 GENERAL, AND MOULTON IRRIGATED LANDS CO. 334 GENERAL.

(6) THE DIVERSION IN MAY WAS USED TO SUPPLEMENT THE DIVERSION BY THE PLANT AT MILE 3.9 R AND WAS USED ON THE ACREAGE REPORTED UNDER THAT PLANT.

(7) DIVIDED AS FOLLOWS: (ACRES) WILD FOWL CLUB 250, CALIFORNIA DUCK CLUB 500, FINNIE ROD AND GUN CLUB 350, PUTNAM CLUB 25.

(8) IN ADDITION TO GUN CLUBS UNDER OTHER DIVERSIONS LISTED, THIS COMPRISES THE GROUP OF CLUBS DIVERTING BUTTE CREEK WATER BY GRAVITY FROM THE MAIN OR INTERCONNECTING CHANNELS (SANBORN SLOUGH, ETC.) IN THE VICINITY OF MILE 10. THROUGH R.D. 833 CANALS, MOST OF THE CLUBS IN THIS GROUP RECEIVE ALSO, DRAINAGE AND FEATHER RIVER WATER DIVERTED FOR THE CLUBS BY WESTERN CANAL. THESE DIVERSIONS ARE PRINCIPALLY IN THE FALL MONTHS AND THOSE FROM BUTTE CREEK HAVE NOT BEEN MEASURED. FOR DIVERSIONS VIA WESTERN CANAL SEE TABLE OF FEATHER RIVER DIVERSIONS MILE 59.7 R. THE AREA FLOODED BY THIS GROUP IS ESTIMATED TO BE APPROXIMATELY 5000 ACRES. THE CLUBS INCLUDED ARE WHITE MALLARD, WILD GOOSE, LAST CHANCE, BERRY AND KELLER, TULE GOOSE, BETTENS, GREENHEAD, FIELD AND TULE, NORTH BUTTE, HENSHAW, SACRAMENTO OUTING, ANDERSON, WEST BUTTE, AND COLUSA SHOOTING.

(9) PLANT IS ON HOWARD SLOUGH BUT OPPOSITE THIS MILEAGE ON BUTTE CREEK.

(3) BEANS AND CORN ON GUN CLUB ACREAGE.

(4) SEE ACREAGE NOTES RECLAMATION DISTRICT 1004 MILE 9.3 R.

(5) DIVERSION UP TO SEPTEMBER FOR SUDAN GRASS ON GUN CLUB ACREAGES. OCTOBER DIVERSION FOR DUCK PONDS.

(6) DIVIDED AS FOLLOWS: (ACRES) CALIFORNIA DUCK CLUB 550, WILD FOWL CLUB 325, FINNIE ROD AND GUN CLUB 300, AND BUTTE LODGE GUN CLUB 250.

(7) IN ADDITION TO GUN CLUBS UNDER OTHER DIVERSIONS LISTED, THIS COMPRISES THE GROUP OF CLUBS DIVERTING BUTTE CREEK WATER BY GRAVITY FROM THE MAIN OR INTERCONNECTING CHANNELS (SANBORN SLOUGH, ETC.) IN THE VICINITY OF MILE 10. THROUGH R.D. 833 CANALS, MOST OF THE CLUBS IN THIS GROUP RECEIVE ALSO, DRAINAGE AND FEATHER RIVER WATER DIVERTED FOR THE CLUBS BY WESTERN CANAL. THESE DIVERSIONS ARE PRINCIPALLY IN THE FALL MONTHS AND THOSE FROM BUTTE CREEK HAVE NOT BEEN MEASURED. FOR DIVERSIONS VIA WESTERN CANAL SEE TABLE OF FEATHER RIVER DIVERSIONS MILE 59.7 R. THE AREA FLOODED BY THIS GROUP IS ESTIMATED TO BE APPROXIMATELY 5000 ACRES. THE CLUBS INCLUDED ARE WHITE MALLARD, WILD GOOSE, LAST CHANCE, BERRY AND KELLER, TULE GOOSE, BETTENS, GREENHEAD, FIELD AND TULE, NORTH BUTTE, HENSHAW, SACRAMENTO OUTING, ANDERSON, WEST BUTTE, AND COLUSA SHOOTING.

(8) PLANT IS ON HOWARD SLOUGH BUT OPPOSITE THIS MILEAGE ON BUTTE CREEK.

* APPROXIMATE MILEAGE FROM JUNCTION WITH SACRAMENTO RIVER.

(1) ONLY DIVERSIONS WHICH OCCURRED PRIOR TO NOVEMBER 1ST ARE GIVEN FOR GUN CLUB ACREAGE. IN MOST INSTANCES THE DIVERSIONS FOR THIS PURPOSE EXTENDED INTO NOVEMBER AND DECEMBER.

(2) BUTTE SLOUGH IRRIGATION COMPANY MAINTAINS A DAM ON BUTTE SLOUGH JUST ABOVE ITS JUNCTION WITH SACRAMENTO RIVER AND THEREBY DIVERTS WATER VIA BUTTE SLOUGH TO EAST AND WEST BORROW PITS OF SUTTER BY-PASS NEAR "LONG BRIDGE". THE TOTAL WATER SO DIVERTED IS HERE SHOWN. REDIVERSIONS FROM WEST BORROW PIT OF SUTTER BY-PASS WERE MADE AT MILES 28.4, 28.6 AND 29.0 R. (SEE SUTTER BY-PASS DIVERSIONS TABLE 61.)

(3) SEE ACREAGES UNDER REDIVERSIONS AT MILES 28.4 R, 28.6 R, AND 29.0 R, —WEST BORROW PIT SUTTER BY-PASS. A CONSIDERABLE ADDITIONAL BUT INDEFINITE ACREAGE WAS SERVED BY SUB-IRRIGATION AND DIRECT DIVERSIONS FROM FLOW DIVERTED TO EAST BORROW PIT OF SUTTER BY-PASS WHICH IS JOINED BY FEATHER RIVER RETURN FLOW ENTERING VIA WADSWORTH CANAL. SEE EAST BORROW PIT SUTTER BY-PASS DIVERSIONS, TABLE 61, AND FOOTNOTE TABLE 116.

(4) INCLUDES 30 ACRES ON ADJOINING GRAY PROPERTY.

(5) INCLUDES MESSICK 13, BANK OF AMERICA 20, C. P. REISCHE 80, S. E. REISCHE 60, FEITH AND GRANNERMAN 8.

(6) ARMSTRONG 54, COLUSA COUNTY BANK 16 AND ADJOINING HANSEN LAND 40.

(7) NEW INSTALLATION 1934.

(8) DOES NOT INCLUDE ACREAGE UNDER DIVERSION TO SUTTER BY-PASS — SEE FOOTNOTES (2) AND (3).

(9) NOTE THAT THIS INCLUDES AN ESTIMATE OF 5000 ACRES FOR WHICH THE DIVERSIONS ARE NOT REPORTED.

* APPROXIMATE MILEAGE ALONG RIVER ABOVE HIGHWAY CROSSING AT MARYSVILLE.

(1) REPORTED TO HAVE OPERATED IN 1932. NOT PREVIOUSLY LISTED.

(2) MILEAGE CORRECTION.

(3) REPLACES FORMER 8" UNIT.

(4) SOME ADDITIONAL WATER FOR THIS ACREAGE OBTAINED FROM WELLS.

(5) NEW INSTALLATION 1933 AT FORMER POINT OF DIVERSION.

(6) MILEAGE CORRECTION. PREVIOUSLY LISTED AS 4.5 L.

(7) INCLUDES 20 ACRES ON ADJOINING EARL FRUIT COMPANY ORCHARD (DANTONI ORCHARDS).

(8) LISTED ERRONEOUSLY IN 1932 AS L. A. PLANTZ AT MILE 6.8 L. PUMP WAS NOT MOVED IN NOVEMBER 1931 AS REPORTED.

(9) MILEAGE CORRECTION. PREVIOUSLY LISTED AS 6.2 L.

(10) MILEAGE CORRECTION. PREVIOUSLY LISTED AS 6.6 L.

(11) HALLWOOD IRRIGATION COMPANY AND CORDUA IRRIGATION DISTRICT HAVE A COMMON POINT OF DIVERSION AND COMMON CANAL FOR ABOUT ONE-HALF MILE; DIVERSION AND ACREAGE FIGURES ARE FOR COMBINED PROJECTS. IRRIGATED ACREAGE IS SEGREGATED AS FOLLOWS: HALLWOOD, RICE 900, GENERAL 5000; CORDUA, RICE 1745, GENERAL 355.

(12) CONTINUOUS GRAVITY DIVERSION. WATER IS USED ON ORANGE GROVE AND SURPLUS RETURNS TO RIVER VIA DREDGER PONDS AND ROCK PILES. GREATER DIVERSION APRIL TO JULY WAS IN CONNECTION WITH CONSTRUCTION OF NEW DREDGE AT HAMMONTON.

(5) ADDITIONAL WATER FOR DINSMORE ACREAGE RECEIVED THROUGH PLANT AT MILE 5.15 L.
(6) DINSMORE 60, EARL FRUIT COMPANY (DANTONI ORCHARDS) 60.
(7) HALLWOOD IRRIGATION COMPANY AND CORDUA IRRIGATION DISTRICT HAVE A COMMON POINT OF DIVERSION AND COMMON CANAL FOR ABOUT ONE-HALF MILE; DIVERSION AND ACREAGE FIGURES ARE FOR COMBINED PROJECTS. IRRIGATED ACREAGE IS SEGREGATED AS FOLLOWS: HALLWOOD, RICE 450, GENERAL 5450; CORDUA, RICE 1217, GENERAL 300.
(8) CONTINUOUS GRAVITY DIVERSION. WATER IS USED ON ORANGE GROVE AND SURPLUS RETURNS TO RIVER VIA DREDGER PONDS AND ROCK PILES.

CHAPTER IV

MEASUREMENTS OF RETURN WATER

Sacramento Return Waters

In the Sacramento Valley the flow of all well defined channels carrying irrigation waters returned to the Sacramento River is measured and recorded. Tables 85 and 86 list these channels in downstream order and give the total flow as computed from the measurements.

Between Colusa and Red Bluff there are no large well defined return channels. Records or estimates of all natural inflow from streams in this stretch of the river were, however, obtained. Above Red Bluff, from a point below Cottonwood to Redding there is a return from the irrigation of the Anderson-Cottonwood Irrigation District.

Return Flow from other than Sacramento River Sources

In the water returned to the Sacramento River as included in Tables 85 and 86 it should be noted that practically all of that entering the river through Butte Slough is derived from Feather River diversions through the Western and Sutter Butte canals. Of the discharge entering through Sacramento Slough, that portion flowing down the East Borrow Pit of Sutter By-Pass, is, also, practically all of Feather River origin.

Relation of Sacramento Return Water to Irrigation Draft

Tables 87 to 90, inclusive, record the Sacramento River return water, June to September, inclusive, 1933 and 1934, and indicate the relation between the return and the diversions from which it was derived. The high figure of 76 per cent for the June 1933 return flow (Table 88) indicates that probably in that month there was still considerable drain-

age and seepage from natural local sources, not return from diversions. For this reason, Table 88-A giving only the figures for July to September, inclusive, may indicate more correctly the draft-return water relation in the 1933 season. Since, in Tables 87 to 90, it is the purpose to show the return water from Sacramento River diversions only, the inflow from Butte Slough, East Borrow Pit of Sutter By-Pass, Back Borrow Pit of Reclamation District 1000 and from the Feather and American Rivers has been excluded. In Tables 87 and 89 is shown the relation to the diversions of that return water only which was measured at the well defined channels. With the records available for the discharge of the Sacramento River at Red Bluff, Butte City, Colusa, Wilkins Slough, Knights Landing, and Verona and all diversions between these points recorded, as well as the Feather River and other well defined inflows, it is possible to compute what should represent the total water returned to the river between each of these points, including not only the flow in the definite channels which were measured, but all seepage, groundwater return, etc., which could not be directly measured. The figures for the return water computed in this manner and the relation of this return to the draft are shown in Tables 88, 88-A and 90. It should be noted, however, that the return shown for the Verona-Sacramento section is only that contributed by the measured drains since, as explained in Chapter II, the total return in this section including all accretions is not susceptible of computation in the manner outlined because of the fact that no record of flow actually measured at Sacramento is available.

A comparison of the data of these tables for the periods July to September, 1933 and June to September, 1934, shows that seepage, ground-

water return, etc., which could not be directly measured, amounted to 21 per cent of the irrigation draft in 1933 and 19 per cent in 1934. The direct return measured in definite channels amounted to 27 per cent of the draft in 1933 and 26 per cent in 1934. The total return in the respective periods amounted to 48 per cent of the draft in 1933 and 45 per cent in 1934.

A comparison of the accumulated return water and the accumulated irrigation draft, in downstream order, Red Bluff to Sacramento, for the period June to September, inclusive, 1934, is shown on Plate 1. This shows also for the same period, the average discharge, inflow and draft at all points in this stretch of the river. The return water line is plotted from the data of Table 90.

Draft-Return Water Relation for Particular Sacramento Valley Areas

In the Sacramento Valley there are certain units or districts that are set apart physically by levees or otherwise, so that the return water in each district may be readily segregated when the records of all diversions to and discharges from the unit are available. Included in such units are, the area above the Colusa-Williams Highway Crossing of Colusa Trough, Reclamation District 108, and Reclamation District 1500. The relation between draft and return water for the Colusa Trough area is shown in Tables 91 and 92 and for Reclamation Districts 108 and 1500, in Tables 93 and 94, respectively.

Tables 99 to 127, inclusive, present in detail the discharge records for the Sacramento Valley return water channels.

San Joaquin Return Waters

In the 1933 and 1934 San Joaquin Valley return water measure-

ments, the gaging stations were located at the same points as in previous years beginning with 1928, and the same methods were followed. A continuous record of the discharge during the season was obtained at an upper and lower station on each stream: San Joaquin, Stanislaus, Tuolumne and Merced Rivers. On the Tuolumne and San Joaquin Rivers, continuous records of discharge were also obtained at intermediate stations; one on the Tuolumne River at Hickman Bridge and two on the San Joaquin River, one near Grayson (Laird Slough) and the other just below the junction with Merced River. The latter is the station maintained by the U. S. Geological Survey and referred to as "San Joaquin River near Newman." (See Tables 26 and 27). Maintenance of these stations was started in April or early May. However, in June of 1933 high water from natural flow had the effect of vitiating return water determinations from the measurements for that month so that the 1933 figures are only given beginning with July. Measurements and records of all pumping diversions between stations on each stream were obtained, thereby completing the necessary data for the computations of the return water. The records for the gaging stations are given in Chapter II, Tables 24 to 47, inclusive, and the diversion records for the San Joaquin streams are given in Chaper III, Tables 76 to 83, inclusive.

Tables 95 and 96 give the results of the San Joaquin return water measurements and Tables 97 and 98 show a comparison of the return water with the irrigation draft in the San Joaquin Valley. Plate 2 depicts the accumulated return water on the San Joaquin River in downstream order, Delta Bridge to Vernalis gaging station, for the period June to October, inclusive, 1934 and shows also for this period, the average discharge, inflow and draft at all points in this stretch of the river.

Comparative Sacramento and San Joaquin Return Water, 1924 to 1934

Comparative figures, 1924 to 1934, for the Sacramento and San Joaquin seasonal return water in per cent of the irrigation draft are shown in Table 84. Figures for the seasonal stream flow in per cent of the 40-year mean 1889-1929, of the Sacramento River at Red Bluff and the San Joaquin River and its three main tributaries above the Vernalis gaging station are given also in order to show what relation, if any, there may have been between the variation from year to year in the run-off and the variation in the return water percentages. With respect to the Sacramento River data, there appears to be a fairly close relationship between the seasonal run-off at Red Bluff and the return flow percentages. The higher return flow percentages occurred in the years of good run-off and the decrease in percentage in the years when the run-off was greatly below normal is quite marked. This is undoubtedly a reflection of the conservation and waste prevention measures effected in the seasons of low water supply. In these seasons, the spill from the rice fields and all controllable wastes were practically eliminated in order that the river diversions might be reduced accordingly. The latter, then, approached more nearly the actual consumptive requirements of the crops so that the return flow percentage was considerably smaller. In the seasons of less critical water supply and correspondingly less urgent demand for conservation, the greater facility in irrigation operations obtained by larger diversions and correspondingly greater wastes and spill, may offer an explanation of the larger return water percentages in these seasons. In the years of more normal stream flow there probably occurs also, a greater accretion from groundwater storage, etc., and in this event the additional return from this source should not, strictly speaking, be included in the per-

centage figures since this would not be a return derived from the irrigation draft.

In the case of the San Joaquin return water data there appears to be no such definite relation between the seasonal flow of the San Joaquin River and its tributaries in per cent of normal and the return water percentages. This may be due to the regulation which occurs in Lake McClure on the Merced River, Don Pedro Reservoir on the Tuolumne River and Melones Reservoir on the Stanislaus River. It is to be noted that in some years the period used in the comparison of return flow and diversions makes considerable difference in the percentage figures, and further, that for the period August-September only, the percentage is nearly always greater than when the July-September period is used. Under the suspicion that there may be a considerable lag between the diversions and corresponding return flow, the figures in the last column of Table 84 were compiled to show the August-September return flow in per cent of the July-August diversions. These percentages still seem to bear no definite relation to the seasonal run-off percentages but their variation from year to year is somewhat reduced and a more or less constant percentage of return flow is indicated.

The average percentage of diversions occurring as return water in the San Joaquin River is shown to be considerably smaller than that for the Sacramento River. This difference may probably be attributed to the fact that, whereas, due to basin topography, practically all drainage from Sacramento River diversions is quickly returned to the river, in the San Joaquin Valley, much of the drainage from the major foothill diversions may pass to the underground water and from there,

in the lower areas of many of the irrigation districts, be recovered by drainage pumps for re-use in the irrigation canals. Considerable of the San Joaquin return, therefore, may never reach the river to be accounted for in the return water measurements.

Total Draft - Red Bluff to Sacramento	169725	2850	175982	2860	164848	2630	84812	1430	595367	2460					
Return in per cent of Draft	76 (1)		46		38		72		56						

* As the return water in this table between any two stations is computed as the difference in discharge between the upper and lower station, making due allowance for the intervening diversions, the results include both those accretions entering from definite return channels which have been measured and accretions due to seepage, groundwater return, etc. which cannot be directly measured.

** See discussion in text of Chapters II and IV.

NOTE: In the return water here shown the discharge to the Sacramento River of the Feather and American Rivers is excluded as is also return through Butte Slough, a portion of the return through Sacramento Slough derived from Feather River diversions and the return through the Back Borrow Pit of Reclamation District 1000. Also, inflow from Mill, Antelope, Deer and other creeks between Red Bluff and Butte City has been excluded.

(1) The high percentage for June indicates that probably in that month there was still considerable drainage and seepage from natural local sources, not return from diversions. (Compare with June return, Table 87). Table 88-A, following, made up for July to September, inclusive, probably indicates more correctly, therefore, the draft-return water relation in 1933.

* As the return water in this table between any two stations is computed as the difference in discharge between the upper and lower station, making due allowance for the intervening diversions, the results include both those accretions entering from definite return channels which have been measured and accretions due to seepage, groundwater return, etc., which cannot be directly measured.

** See discussion in text of Chapters II and IV.

NOTE: In the return water here shown the discharge to the Sacramento River of the Feather and American Rivers is excluded as is also return through Butte Slough, a portion of the return through Sacramento Slough derived from Feather River diversions and the return through the Back Borrow Pit of Reclamation District 1000. Also, inflow from Mill, Antelope, Deer and other creeks between Red Bluff and Butte City has been excluded.

NOTE: This is the drainage from Colusa Basin passing down the Back Borrow Pit of Reclamation Districts 108 and 787 and entering the Sacramento River at Mile 34.15 Right, just above the Knights Landing gaging station. It includes the drainage from Reclamation District 787 entering the Back Borrow Pit via Sycamore Slough outlet. Marked irregularities in the flow are due to checking operations at the Knights Landing outfall gates whereby a portion of the flow of the Back Borrow Pit is diverted to the Knights Landing Ridge Cut. This diversion is shown in Table 120.

*Beginning of record for season.
**Partial month.
***Record from June 23d to August 25th lost due to temporary discontinuance of Water Supervisor work.

NOTE: This is return water discharged to Sacramento River via Sacramento Slough at Mile 21.2 Left. For the period prior to June 1st it is the sum of the flow as measured at three points: (1) Outlet of R.D. 1500 Drain (Table 114), (2) East Borrow Pit Sutter By-Pass at Chandler (Table 116), and (3) West Borrow Pit Sutter By-Pass opposite Gelshauser Slough (Table 118). Subsequent to June 1st it is the sum of the flow as measured at (1) and a new lower station on the West Borrow Pit below the junction of the flow passing (2) and (3). See Table 119.

*Beginning of record for season.

**Drainage to West Borrow Pit of Sutter By-Pass from rice irrigation in the By-Pass. See Note, Table 116. Beginning June 1st this drainage was measured in the flow passing the new lower station on the West Borrow Pit.

NOTE: This is return water originating from Feather River and Butte Slough Diversions. It is discharged to Willow Slough through a controlled culvert at Chandler, thence across Sutter By-Pass to the West Borrow Pit and thence via the latter and Sacramento Slough (in the By-Pass) to Sacramento River. This is one of three sources measured to obtain the total flow in Sacramento Slough. See Table 111. In 1933 diversions were made from the East Borrow Pit above Chandler for a considerable rice acreage in the By-Pass which drained to the West Borrow Pit below the gaging station on the latter. Estimate of this return is shown in Table 111.

NOTE: This is return water originating from Feather River and Butte Slough Diversions. It is discharged to Willow Slough through a controlled culvert at Chandler, thence across Sutter By-Pass to the West Borrow Pit and thence via the latter and Sacramento Slough (in the By-Pass) to Sacramento River. This is one of the sources measured to obtain the total flow in Sacramento Slough. See Table 112. In 1934 diversions were made from the East Borrow Pit above Chandler for a considerable rice acreage in the By-Pass which drained to the West Borrow Pit below the upper gaging station on the latter. Beginning June 1st this return was measured in the flow passing a new lower station on the West Borrow Pit below Willow Slough junction. Estimate of the April and May return below the upper station is shown in Table 113.

NOTE: This is the flow in the West Borrow Pit below the confluence of East Borrow Pit flow entering via Willow Slough. This point of measurement was newly established June 1, 1934. 1.4 miles downstream this flow is joined by the discharge through R. D. 1500 Drainage Plant and the combined flow is thence discharged via Sacramento Slough (in the By-Pass) to Sacramento River. This is one of the sources measured to obtain the total flow in Sacramento Slough - See Table 112.

CHAPTER V

USE OF WATER IN THE SACRAMENTO-SAN JOAQUIN DELTA

As outlined in preceding reports, this investigation having as its objective, a complete annual determination of the consumptive use of water in the entire Sacramento-San Joaquin Delta, has comprised the experimental work to determine the unit consumptive use of water by the various irrigated crops and vegetation in the Delta and the general field work to obtain annually a complete census of the irrigated crops and water consuming areas. With the unit consumptive use of water determined by the experimental work and the complete census available, the former is applied to the data of the latter to derive the consumptive use of water in the Delta as a whole or on individual tracts or islands.

Due to financial limitations the census of the irrigated crops and water consuming areas in the Delta could not be made in 1933 and 1934. There is, therefore, no record of the Delta consumptive use of water in these years, for this report.

Table 128 summarizes the crop and water consuming areas and figures for the consumptive use of water as previously reported for the years 1924 to 1932 inclusive. It will be noted that in the nine year period shown there has been no very great change in the irrigated crop area and that for the years 1930, 1931 and 1932 the crop areas and total water consuming areas, and consequently the estimates for the total consumptive use of water, are practically constant. From this consideration it appears reasonable to assume that there probably occurred little departure from these figures in the years 1933 and 1934 and that probably the use of water in the latter years may be closely approximated by the consump-

tive use shown for the years 1930, 1931 and 1932.

(1) Total includes interior and exterior water surface, bare and weed lands which consume seepage water, willow and tule areas, etc.
(2) Includes water used by crops and vegetation during the composite growing season and by evaporation for the entire year.
(3) Includes in addition to seasonal use, the use of water on the cropped area during the non-growing or dormant season.
NOTE: Prior to 1929 the annual census was not complete with respect to water consuming areas other than irrigated crop lands.

Cooperative Irrigation Investigations

Through the Federal-State cooperation for Irrigation Investigations the Delta experimental work has been conducted by the Division of Irrigation, Bureau of Agricultural Engineering, U. S. Department of Agriculture, and has included probably as its most successful feature and that furnishing most definite and conclusive results, the consumptive use of water determinations for various Delta crops and vegetation grown in tanks. With the close of the 1930 season, the major portion of this investigation was practically completed. That is, the tank work had covered the range of the principal

crops grown in the Delta as well as some experimentation with aquatic growths and weeds. At that time, therefore, an analysis and summary of the results were submitted by the Bureau of Agricultural Engineering and used as the basis for the computations of the consumptive use of water in the Sacramento-San Joaquin Delta as presented in Bulletin 27 of the Division of Water Resources.

However, the period of the investigation with respect to certain of the consumptive use determinations appeared to have been somewhat short as the basis for final conclusions and it was considered desirable to continue the experimental work on these. In 1931 and 1932 the items included in this continuation of the work comprised the maintenance of tule, cattail, and various weed tanks at King Island, tule tanks at Simmons Island, asparagus tanks on the Richmond-Chase tract, evaporation stations at Grand, King and Simmons Islands and Byron, and a general study of the character, occurrence, and extent of water consuming weed growths in the Delta. In the computations for the 1932 consumptive use of water in the Delta one modification of the unit consumption figures was made on the basis of the data derived by the continued experimental work. This was an increase in the figure for the use of water by weeds, under the classification "Idle Land with Weeds," to correspond to a total annual consumption of 2.15 acre-feet per acre. The experimental work continued in 1933 and brought to a close at the end of that season comprised tule, cattail and various weed tanks at King Island, the asparagus tanks on the Richmond-Chase tract, and evaporation stations on King and Grand islands and at Byron. The work done and the results for 1933 are presented in the following report by Dr. O. V. P. Stout who was in charge of the work for the Division of Irrigation, of the U. S. Bureau of Agricultural Engineering.

COOPERATIVE IRRIGATION INVESTIGATIONS IN THE SACRAMENTO-SAN JOAQUIN DELTA IN 1933

By

O. V. P. Stout,
Irrigation Engineer,
Division of Irrigation,
Bureau of Agricultural Engineering,
United States Department of Agriculture.

INTRODUCTION

Cooperative irrigation investigations directed primarily to the determination of the amount of water used consumptively in the Sacramento-San Joaquin Delta were begun in 1924. The results have been set forth annually in the mimeographed reports of the Sacramento-San Joaquin Water Supervisor. Bulletin No. 23 of the Division of Water Resources, Department of Public Works, State of California, contains a summary of the work for the five-year period 1924-1928. The information secured has been an important factor in the consideration of the Central Valley Project and in the preparation of Bulletins No's. 27 and 28 of the Division of Water Resources, entitled respectively "Variation and Control of Salinity in Sacramento-San Joaquin Delta and Upper San Francisco Bay" and "Economic Aspects of a Salt Water Barrier Below Confluence of Sacramento and San Joaquin Rivers."

This report is a statement of the progress made with the undertaking in the year 1933. The work of that year was carried on in an atmosphere of uncertainty from time to time as to whether funds for its support in the period just ahead would be forthcoming, but the final outcome was the completion of the season's work on the reduced scale which has obtained since 1930, when it was decided that a serviceable knowledge of the water

required for the irrigation of Delta crops had been built up, and that there remained only the investigation of the demands of aquatic plants, weeds and other non-crop plants.

TANK EXPERIMENTS

Experiments on the consumptive use of water by plants growing in tanks were conducted along the same lines as in 1932. Weeds and aquatic plants were observed in double tanks of galvanized iron consisting of an inner cylinder about 2 feet in diameter, perforated at the bottom and containing the soil. This inner cylinder was set in an outer water-tight cylinder of diameter a few inches greater. Each tank presents 2.9 square feet of soil surface, so that 15,000 (closely approximate) of them would be required to provide soil surface amounting to one acre. The asparagus tanks were of the same material and same type, but of larger diameter, each tank presenting 9.28 square feet of soil surface, and requiring 4,694 of them to make an acre. All tanks were 5 feet deep, and set in the soil so that their tops were slightly higher than the surrounding ground surface. A device was used in transplanting weeds, by means of which their setting in the tank was the undisturbed top foot of soil in which they had sprouted.

Tules and Cattails on King Island - Two tanks of tules and two of cattails were set in a patch of these plants at Camp 3, King Island, in the summer of 1930. Plants grew in the succeeding years from the roots of the original transplanting. The results for 1933 are shown in Table 129.

All living plants in the tanks were frozen in December, 1932, and little new growth was noted until after the patch was burned over on March 10, 1933. The cattails grew very rapidly in the ten days fol-

lowing the burning, so that as observed on March 21st the stalks were from 2 to 6 feet high. The ruling heights of tule stems on the same date were 6 and 12 inches. On March 22d all dead (1932) stalks and stems were cut off at the ground surface, water was pumped out of the tanks and fresh water put in. The water pumped out had not become noticeably brackish.

The observer's field note-book, containing the record of observations from April 30th to June 11th, inclusive, was lost. The use of water was therefore estimated for that period, taking into account for each tank the daily rates of use just before April 30th and just after June 11th, and also the season's record of evaporation at the weed tank plot on King Island.

As in 1932, the cattails in Tank No. 2 and the tules in Tank No. 3 seemed normal as compared with plants in the patch. The cattails in Tank No. 1, likewise as in 1932, were of inferior growth. The fact that the soil of the tank did not take water readily leads to the presumption that there was an overcrowding of roots. The tules in Tank No. 4, for some unknown reason, also grew somewhat less vigorously than the surrounding plants in the patch. It may be remarked (Table 129) that the use of water corresponds in a general way with the growth and vigor of the plants in the respective tanks noted above.

Weeds on King Island - The battery of 20 tanks on King Island, (p. 138, Water Supervisor's Report for 1932) was increased in May, 1933 by the transfer of four tanks from Simmons Island. The surrounding field crop was barley, as it was in 1932. The barley constituted practically the only protection of the tank-grown weeds from undue exposure to sun and wind. The harvest of the barley in early summer left the experimental weeds without

material protection except for weeds growing in the fence around the tank plot.

The stubble field surrounding the weed tanks was irrigated by flooding late in August and water entered the tank plot and flowed over the tops of tanks No's. 2, 5, and 6, and 15 to 24 inclusive. There is consequently at least a small measure of uncertainty in the interpolated reckoning of the use of water in a period of a few days including the date of the flooding.

Tanks No's. 2 and 6 contained each one plant curly dock (Rumex crispus), and tank No. 15 two plants of the same, transplanted from the field on February 9th. Tank No. 20 contained three plants of green dock (Rumex conglomeratus) transplanted on March 2d. The green dock in Tank No. 20 was harvested completely on July 19th. The curly dock in Tank No. 15 was harvested completely on July 1st, and in the other tanks was not finally harvested until November 10th, but the seed stems and matured leaves and stalks of a first growth were cut on various dates in June and July. The results, Table 130, show that a crop stand of dock would produce a heavy yield and use enough water to serve two or three times as great an area of field crops. A full stand of the plant on an area is seldom or never encountered, however, as it grows in scattering fashion on neglected wet areas and pastures, and more compactly on ditch banks and slopes, including roadside ditches. It is strongly frost resistant and accomplishes more or less of growth in the winter season in California.

On May 27th western goldenrod (solidago occidentalis) from the north side of the county road on King Island was set in tanks No's. 10 and 18. The plants grew and proved to be heavy users of water. They were

harvested on November 10th. At the close of the season the plants in the two tanks presented different styles of growth. Twenty-two plants with from 1 to 5 stalks to the plant were counted in tank No. 10. Tank No. 18 contained two plants with a total of 17 stalks. At the time of harvest the blooms had ripened, but the plants were in full green leaf and using water. Some new shoots were noted starting upward from the roots. Plants were 4 feet or a little more in height. The numerical data of the experiment are set forth in Table 131.

On March 23d some barley with weeds was transplanted to the tanks from a field in the north half of King Island. The weeds consisted mostly of wild mustard and radish. It is estimated that birds got about two-thirds of the grain as it ripened. At the time of transplanting the ruling height of the barley was about 6 inches in Tanks No's. 3, 7, and 11, and about 7 inches in Tank No. 14. The mustard, radish, etc. were then quite close to the ground in all tanks. Aphis appeared near the end of May on the mustard in the tanks and they were sprayed, but not before the plants in tank No. 11 had suffered considerable damage. The grain and weeds in these tanks were harvested on June 25th and 26th. The quantitative data of the experiment appear in Table 132.

On November 16, 1932 the so-called kelp (Polygonum amphibium, var. Hartwrightii) was introduced into tanks No's. 4, 8, 12, 16, and 19, by taking roots from the field and burying them about 2 or 3 inches beneath the surface of the soil in the tanks. They did not get much of a start in growth during the winter, and use of water was correspondingly low. Up to May 19th the use in the five tanks, No's. 4, 8, 12, 16, and 19 was respectively 1.42, 0.82, 1.62, 0.83, and 1.04 acre-feet per acre.

TABLE 131

USE OF WATER BY AND YIELDS OF WESTERN GOLDENROD (SOLIDAGO OCCIDENTALIS) GROWN IN TANKS AT KING ISLAND, 1933

Item	Tank Number 10	18
Nominal depth to water table in feet	2.50	2.50
Record of use of water begun	May 31	May 31
Cumulative Use of Water in Ac.Ft./Ac. to August 13	4.38	3.24
Cumulative Use of Water in Ac.Ft./Ac. to November 10	8.04	5.75
Date of harvest	Nov.10	Nov.10
Yield of air-dry matter in aerial portion of plant, Tons per Acre	8.88	5.62

Transplanted May 27th from north side of county road, south side of check 1, camp 3, King Island.

Table 133 shows, along with the other quantitative data, that by the time of harvest of the kelp on November 10th the total use of water in 12 months had reached a considerable amount, averaging for the growing season nearly or quite twice the alfalfa requirement.

Seedling plants of lambs' quarters (Chenopodium album) were taken from the field on May 6th, 8th, and 9th and set in Tanks No's. 1, 5, 9, 13, and 17, from which nettles had been removed a few days previously, after having occupied the tanks for 13 months. The lambs' quarters plants were harvested on September 20th, at which time the use of water and the yield of the air-dry aerial portion of the plants were as indicated, along with other data, in Table 134. In the period from transplanting up to August 12th they had used about 80 per cent of the amount of water that they used up to harvest.

The tanks brought over from Simmons Island and set in the weed tank plot on King Island were designated as No's. 21, 22, 23, and 24. Nut-grass from the field was set in these tanks on May 26th and 27th, at which time the ordinary range of lengths of grass blades was from 4 to 14 inches, with prevailing length about 10 inches. The grass lived throughout the season, and grew some, but did not fruit. By the end of October the grass in all four tanks was apparently dead, and on November 8th it was harvested. The quantitative data of the experiment appear in Table 135.

Tanks No's. 3, 7, 11, 14, 15, and 20 were permitted to sprout volunteer crops of weeds after mustard and grain were removed from No's. 3, 7, 11, and 14 on June 25th and 26th, and dock from No. 15 on July 1st and from No. 20 on July 19th. This procedure gave a random density of

Yield of air-dry matter in aerial portion of plant, Tons per acre	2.29	3.37	5.19	3.60

Nut-grass transplanted from field to tanks on May 26-27.

stand of plants in the tanks, as distinguished from a selected and therefore probably overdense stand in the instances of transplanting. Table 136, which includes with other quantitative data, the use of water, shows that although this use considerably exceeds that of the general run of crop plants, the excess is of less magnitude than in a good many of the instances of transplanted weed growths.

The nettle (Urtica gracilis var.), so common along ditch banks in the Delta, come up in 1933 in Tanks No's. 1, 5, 9, 13, and 17, from roots which had supported plants in 1932. None of them thrived, and on May 4, 1933 all of them were harvested. The record of use of water and yield of plants is given in Table 137.

Asparagus on Richmond-Chase Ranch - The twelve asparagus tanks on Richmond-Chase ranch No. 7, three miles east of Terminous, were continued in service and under observation in 1933. This was the seventh season of record for this experiment, the nursery crowns having been set in the tanks in 1927. The amounts of water used and the yields of spears and tops or fern are given in Table 138.

Table 139 gives average water used and average yields of tops and spears for each of the seven years of the experiment.

METEOROLOGICAL RECORDS

Equipment for obtaining records of rainfall, evaporation, temperature, and humidity was in place in 1933 at King Island, Grand Island, and Byron. Of the records thus obtained only that of rainfall at King Island will be reported here, along with rainfall record furnished by Mr. H. F. Churchill, superintendent for the Richmond-Chase Company. These records are set forth in Table 140.

TABLE 136

USE OF WATER BY VOLUNTEER WEEDS GROWN IN TANKS AT KING ISLAND, 1933

Item	Tank Number					
	3	7	11	14	15	20

TABLE 137

USE OF WATER BY AND YIELDS OF NETTLES (URTICA GRACILIS VAR.) GROWN IN TANKS AT KING ISLAND, 1933

Item	Tank Number				
	1	5	9	13	17
Record of use of water begun	Jan. 3	Jan. 2	Jan. 3	Jan. 9	Jan. 4
Date of harvest 1933	May 4	May 4	May 4	May 4	May 4
Nominal depth to water table, in feet	3.50	3.00	2.50	2.00	1.50
Cumulative use of water in Ac.Ft./Ac. to May 4, 1933	1.03	0.88	0.85	0.44	0.64
Yield of air-dry matter in aerial portion of plant, Tons per acre	2.32	1.52	1.30	0.52	1.48

Tank 1 contained a nettle growing from an old root, set in April, 1932. The plants in the other tanks came up from roots of seedlings transplanted from the field in April, 1932.

All were harvested and the roots dug out on May 4, 1933, as none was doing well and the growths were not representative of plants growing at large.

TABLE 138

USE OF WATER, WEIGHT OF TOPS (1) AND YIELD OF SPEARS, ASPARAGUS TANKS, RICHMOND-CHASE TRACT, NEAR TERMINOUS, 1933

Tank Number	Sex of Plant (2)	Depth to water table (3)	Water used in 1933	Weight of tops in 1933 (4)	Water used in 1932 (5)	Weight of Spears in 1933
		Feet	Acre-feet per Acre	Grams	Acre-feet per Acre	Grams
1	P	2	3.80	1,396	3.13	802
2	S	2	5.26	786	3.64	1,187
3	P	2	4.47	881	2.81	2,055
4	P	2	3.47	641	2.90	747
5	P	3	1.76	124	1.37	391
6	S	3	3.66	342	2.55	1,436
7	P	3	2.76	735	2.18	860
8	S	3	4.06	450	2.35	855
9	P	4	3.30	638	2.24	1,526
10	S	4	1.57	219	1.69	660
11	P	4	4.30	1,135	3.04	956
12	S	4	2.00	312	1.53	728

(1) Tops were weighed following a period of damp weather, so that these weights are probably somewhat in excess of the truth for dry weight. Duplicate weighings of dock in dry weather and in damp weather, respectively, showed the damp-weather weights to be 10 per cent greater than the dry-weather weights.

(2) P signifies pistillate, S staminate.

(3) Nominal approximate depths. Actual depths in general exceeded these somewhat, the excess occasionally amounting to as much as one foot in some tanks.

(4) Including berries. Separation of berries prevented by moulding.

(5) Given for consideration with weight of spears in 1933.

TABLE 139

CHAPTER VI

SALINITY INVESTIGATION

Purpose

The purpose of the salinity investigation, as outlined in previous reports, has been to record the occurrence and extent of the encroachment into upper Bay and Delta channels of salinity from San Francisco Bay, and to establish the relation between movement of salinity, stream flow to the Delta, and tidal action. As reported in Bulletin 27 of the Division of Water Resources, this relation was established for the conditions which obtained during the period of the special investigation for that Bulletin and upon the basis of all data available to that time. Subsequent investigations, therefore, have been directed to the maintenance of an unbroken record of the salinity, tidal and stream flow variations, essential not only in corroboration of the relation as at present established but as the basis for a check of possible modifications in the relation due to changes in channel and tidal conditions which may have taken place or will occur in the future. Also, in such seasons as that of 1934, the continuation of salinity sampling has been essential in keeping Delta irrigators advised of conditions so that damage from the use of water of too high salt content might be averted.

Scope

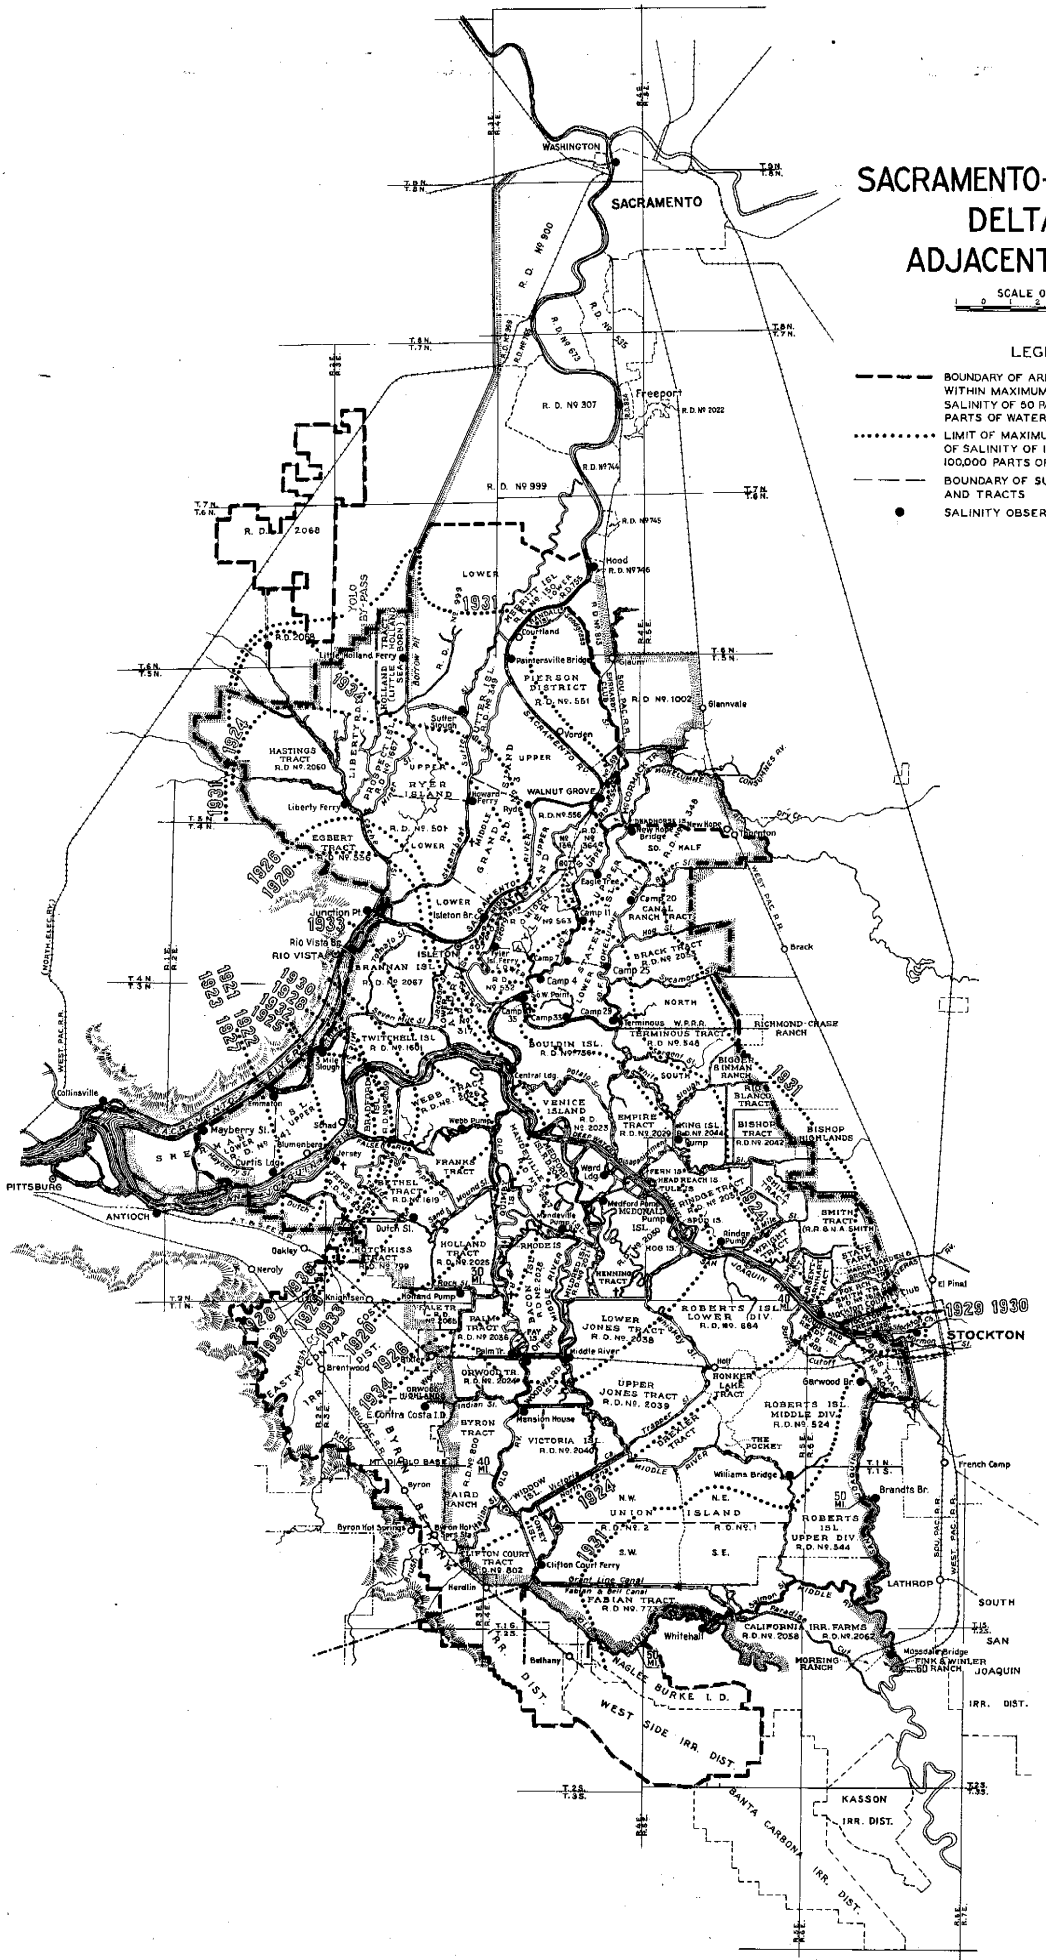
The scope of this investigation each season has been such as to insure that samples of water to be tested for salinity would be taken at regular intervals at a sufficient number of stations throughout the Delta and upper Bay region that the advance and retreat of the salinity from

early Summer to late Fall would be completely recorded. In 1933 and 1934 the Summer stream flow to the Delta dropped to minimums of 1900 and 1400 second-feet, respectively, and in each year the location of the line representing salinity encroachment of 100 parts of chlorine per 100,000 parts of water was, correspondingly, well up in the Delta. In 1934 particularly, the encroachment approached very closely that of 1924, in fact exceeding the latter in the Sacramento Delta but stopping somewhat short of it in the San Joaquin Delta. This is indicated on Plate 3 which shows the limit of encroachment into the Delta of 100 part salinity in the years 1920 to 1934, inclusive. Sixteen Bay and Delta sampling stations are maintained permanently throughout the year, and seventeen additional stations in 1933 and thirty-four additional in 1934 were established and maintained for the duration of the season in order to completely record the encroachment and recession.

Station Maintenance and Records

As in the past, the salinity sampling at all regular stations was done by local observers. Each observer was provided with a schedule showing the exact time for taking the samples so that, throughout the Delta at four-day intervals, all samples would be taken at approximately one and one-half hours after the same high tide. The observers were furnished with stamped containers for the sample bottles so that the latter could be mailed as filled to the laboratory at Sacramento. All testing was done at the chemical laboratory of the Division of Highways. The records of the tests of all samples taken in 1933 and 1934 are given in Tables 143 and 144, and Table 142 gives the location and description of each station.

The maximum salinity as recorded at the stations operated in



MAXIMUM SEASONAL SALINITY ENCROACHMENT OF 100 PARTS OF CHLORINE PER 100,000 PARTS OF WATER, SACRAMENTO - SAN JOAQUIN DELTA, 1920-1934

PLATE 3

1933 and 1934 is shown in Table 141. For comparative purposes, this table shows also the maximum salinity recorded at these stations in previous years beginning with 1924. A comparison of the Summer stream flow to the Delta in 1933 and 1934 and the corresponding salinity at certain of the lower Delta stations is shown on Plate 4.

Salinity Bulletins

With an exceptionally high encroachment of salinity in the 1934 season, water users throughout the Delta were anxious to obtain the results of the tests in order that their irrigation operations might be governed to prevent the use of water of injurious salt content. In the period from July to October, therefore, bulletins reporting the salinity at the various stations were mailed to a list of more than 200 water users, at weekly or ten-day intervals. In addition, many samples taken by various landowners at points other than the regular stations were tested and the results forwarded to the individuals particularly interested.

Tide Gages

In the analysis of the relation between salinity, stream flow and tidal action as presented in Bulletin 27, the comprehensive information covering the tidal variations throughout the Delta as obtained from the records of the tide gages was indispensable. The record of these gages has therefore been continued as an essential requirement in connection with any further such analysis for subsequent salinity, stream flow and tidal conditions. Of the stations which supplied data used in the investigation for Bulletin 27, four are being maintained by the U. S. Army Engineers, one each by U. S. Coast and Geodetic Survey, U. S. Navy, East Contra Costa Irrigation District and Staten Island Land

Company, and the remaining stations, eight in number, are being maintained by the Water Supervisor. The latter are located at Sacramento, Walnut Grove, San Joaquin end of Georgiana Slough, Sacramento and San Joaquin ends of Three Mile Slough, Antioch, Collinsville, and Mossdale Bridge (San Joaquin River).

ISLETON BRIDGE	68.7	6	30	SACRAMENTO RIVER, ONE MILE UPSTREAM FROM ISLETON.
HOWARD FERRY	71.4	6	55	STEAMBOAT SLOUGH, 1½ MILES BELOW JUNCTION WITH SUTTER SLOUGH.
SUTTER SLOUGH	72.8	7	00	AT JUNCTION WITH MINER SLOUGH.
LITTLE HOLLAND FERRY	73.2	7	05	BACK BORROW PIT OF RECLAMATION DISTRICT 999, TWO MILES ABOVE JUNCTION WITH MINER SL.
RYDE	74.4	7	15	SACRAMENTO RIVER, RIGHT BANK, AT TOWN OF RYDE.
RECLAMATION DIST. 2068	74.6	7	15	HAAS SLOUGH, AT RECLAMATION DISTRICT 2068 PUMPING PLANT.
WALNUT GROVE	77.4	7	25	SACRAMENTO RIVER, HIGHWAY BRIDGE, AT WALNUT GROVE.
PAINTERSVILLE BRIDGE	77.6	7	25	SACRAMENTO RIVER ONE MILE BELOW COURTLAND.
SACRAMENTO*	103.5	9	30	SACRAMENTO RIVER AT SOUTHERN PACIFIC RAILROAD BRIDGE.

* PERMANENT STATION MAINTAINED THROUGHOUT THE YEAR.

TABLE 142 (CONTINUED)

SALINITY STATIONS AT WHICH OBSERVATIONS WERE TAKEN DURING 1933 AND 1934

STATION	MILES FROM GOLDEN GATE	TIME INTERVAL BETWEEN HIGH TIDE AT GOLDEN GATE AND TIME FOR TAKING SAMPLES AT STATION HOURS	MINS.	LOCATION
				MOKELUMNE RIVER DELTA
SOUTHWEST POINT	78.8	7	25	STATEN ISLAND, NORTH FORK MOKELUMNE RIVER, SOUTH BANK, JUST ABOVE JUNCTION WITH SOUTH FORK.
CAMP 33, STATEN ISLAND	80.2	7	30	SOUTH FORK, MOKELUMNE RIVER, NORTH BANK, TWO MILES ABOVE NORTH FORK JUNCTION.
TYLER ISLAND FERRY	81.9	7	40	ON GEORGIANA SLOUGH, ABOUT DUE EAST OF ISLETON.
CAMP 11, STATEN ISLAND	83.1	7	45	NORTH FORK, MOKELUMNE RIVER, EAST BANK, FOUR MILES ABOVE SOUTH FORK JUNCTION.
CAMP 29, STATEN ISLAND	83.4	7	50	SOUTH FORK, MOKELUMNE RIVER, NORTH BANK, OPPOSITE TERMINOUS.
CAMP 25, STATEN ISLAND	86.4	8	05	SOUTH FORK, MOKELUMNE RIVER, WEST BANK, ONE MILE ABOVE SYCAMORE SLOUGH JUNCTION.
CAMP 20, STATEN ISLAND	88.9	8	30	SOUTH FORK, MOKELUMNE RIVER, WEST BANK, ONE-HALF MILE BELOW BEAVER SLOUGH JUNCTION.
				SAN JOAQUIN RIVER DELTA
ANTIOCH*	54.9	5	55	SAN JOAQUIN RIVER, AT CITY WATER WORKS PUMPING PLANT.
CURTIS LANDING	58.9	6	10	SAN JOAQUIN RIVER, RIGHT BANK, ABOUT THREE-FOURTHS MILE ABOVE ANTIOCH TOLL BRIDGE.
JERSEY*	61.4	6	20	SAN JOAQUIN RIVER, LEFT BANK, ONE MILE BELOW MOUTH OF FALSE RIVER.
WEBB PUMP	72.0	7	00	FALSE RIVER, TWO MILES BELOW OLD RIVER JUNCTION.
CENTRAL LANDING*	72.0	7	00	MOKELUMNE RIVER AT CENTRAL LANDING, BOULDIN ISLAND.
DUTCH SLOUGH*	73.0	7	05	AT BETHEL ISLAND BRIDGE.
WARD LANDING	79.6	7	35	SAN JOAQUIN RIVER NEAR JUNCTION WITH LITTLE CONNECTION SLOUGH ON THE SOUTHWEST SIDE OF EMPIRE TRACT.
BACON PUMP	82.9	7	50	OLD RIVER AT BACON ISLAND DRAINAGE PUMPING PLANT, NEAR JUNCTION WITH ROCK SLOUGH.
MANDEVILLE PUMP	83.0	7	50	CONNECTION SLOUGH, NORTH BANK, ONE MILE WEST OF MIDDLE RIVER, ON SOUTH END OF MANDEVILLE ISLAND.
KING ISLAND PUMP	84.2	8	00	HONKER CUT AT EMPIRE TRACT - KING ISLAND FERRY.
RINDGE PUMP*	86.1	8	10	SAN JOAQUIN RIVER, NORTH BANK, ONE MILE BELOW FOURTEEN MILE SLOUGH JUNCTION.
ORWOOD BRIDGE	86.3	8	10	OLD RIVER, AT SANTA FE RAILROAD CROSSING, ORWOOD.
EAST CONTRA COSTA I.D.	86.7	8	20	INDIAN SLOUGH, AT EAST CONTRA COSTA IRRIGATION DISTRICT PUMPING PLANT.
MIDDLE RIVER P.O.*	87.7	8	20	MIDDLE RIVER, EAST BANK, AT SANTA FE RAILROAD CROSSING.
MANSION HOUSE	88.4	8	30	VICTORIA ISLAND, OLD RIVER, EAST BANK, AT JUNCTION WITH NORTH VICTORIA CANAL.
STOCKTON COUNTRY CLUB	90.8	8	45	ON LINDLEY CUTOFF (SAN JOAQUIN RIVER), NORTH BANK, ABOUT THREE-FOURTHS MILE ABOVE BURNS CUTOFF JUNCTION.
CLIFTON COURT FERRY	94.2	9	10	OLD RIVER JUST BELOW JUNCTION WITH GRANT LINE CANAL.
STOCKTON	94.8	9	15	NEAR HEAD OF STOCKTON CHANNEL AT WHARF OF CALIFORNIA TRANSPORTATION COMPANY.
GARWOOD BRIDGE	95.3	9	15	SAN JOAQUIN RIVER. AT DRAWBRIDGE ONE MILE ABOVE SANTA FE RAILROAD CROSSING.
BRANDT BRIDGE	100.6	9	50	SAN JOAQUIN RIVER. AT DRAWBRIDGE SIX MILES ABOVE SANTA FE RAILROAD CROSSING.
WILLIAMS BRIDGE	101.6	9	55	MIDDLE RIVER, ABOUT FOUR MILES BELOW SALMON SLOUGH JUNCTION.
WHITEHALL	104.8	10	20	OLD RIVER, WEST OF JUNCTION OF SALMON SLOUGH AND PARADISE CUT. DUE NORTH OF TRACY.
MOSSDALE BRIDGE*	108.5	10	50	SAN JOAQUIN RIVER AT LINCOLN HIGHWAY CROSSING, ABOUT THREE MILES SOUTHWEST OF LATHROP
				DRAINAGE WATER STATIONS
JERSEY DRAIN	61.4	—	—	JERSEY ISLAND DRAINAGE PUMP ON SAN JOAQUIN RIVER, ABOUT ONE MILE BELOW FALSE RIVER.
GRAND ISLAND DRAIN (STEAMBOAT SLOUGH)	68.2	—	—	GRAND ISLAND DRAINAGE PUMP ON STEAMBOAT SLOUGH, ABOUT THREE MILES FROM JUNCTION POINT.
CAMP 35 DRAIN, STATEN ISLAND	78.7	—	—	STATEN ISLAND, DRAINAGE PUMP ON SOUTH FORK MOKELUMNE RIVER, ONE MILE FROM JUNCTION WITH NORTH FORK MOKELUMNE RIVER.
BACON ISLAND DRAIN	82.9	—	—	BACON ISLAND DRAINAGE PUMP ON OLD RIVER NEAR JUNCTION WITH ROCK SLOUGH.
MANDEVILLE DRAIN	83.0	—	—	MANDEVILLE ISLAND DRAINAGE PUMP ON CONNECTION SLOUGH, ABOUT 1 MILE FROM MIDDLE RIVER.
CAMP 11 DRAIN, STATEN ISLAND	83.1	—	—	STATEN ISLAND DRAINAGE PUMP ON NORTH FORK MOKELUMNE RIVER, FOUR MILES ABOVE JUNCTION WITH SOUTH FORK MOKELUMNE RIVER.

* PERMANENT STATION MAINTAINED THROUGHOUT THE YEAR.
