ACKNOWLEDGMENT

Valuable assistance has been rendered by many individuals and by many public and private agencies in the conduct of the field work and the preparation of data for this report of the Sacramento-San Joaquin Water Supervision activities.

Landowners, water users and the executives, engineers, managers and superintendents of various water organizations throughout the territory covered by this work have cooperated fully in furnishing the many and varied data requested.

The Pacific Gas and Electric Company and the Merced, Modesto, and Turlock irrigation districts have furnished a large number of electric power consumption records for use in the compilation of pumped diversions.

The United States Geological Survey, Department of Interior, has extended valuable cooperation in gathering and assembling stream flow data.

The City of San Francisco Public Utilities Commission, Hetch Hetchy Water Supply, in the San Joaquin Valley, and the United States Bureau of Reclamation, in both the Sacramento and San Joaquin Valleys, have made available a large amount of stream flow data.

The Modesto, Oakdale, and Turlock irrigation districts and the United States Bureau of Reclamation have assisted in observing and maintaining recording gages in the San Joaquin Valley area.

The United States Bureau of Reclamation provided the funds necessary to maintain the regular program of salinity observations in the Sacramento-San Joaquin Delta during 1947.

ADVISORY COMMITTEE

PERMANENT COMMITTEE OF THE SACRAMENTO-SAN JOAQUIN RIVER PROBLEMS CONFERENCE

This Committee, representing the water users and other interests involved, was appointed by the First Sacramento-San Joaquin River Problems Conference in January 1924. Its continued interes and cooperation and particular activity in the pro mulgation of effective conservation measures in th seasons of critical water supply have contributed in large measure to the successful prosecution of the Water Supervision work.

Rosa M. Haldaman	Intermediate Typist Clerk

Harry Searancke
Acting Administrative Assistant

FOREWORD

The number of tables presented in this 1947 Water Supervision Report has been decreased as compared with previous reports. Repetitious data have been consolidated into fewer tables. A large amount of historical data has been deleted with appropriate reference to previous reports. Many tables containing only computative data have been deleted because the scope of this report can not embody all of the possible ways of interpreting the basic data, and attempt has been made, therefore, to minimize the analytical and computative data to such as are obviously of value as a ready reference in the current problems of stream flow, diversions, water utilization and water supervision.

All basic hydrographic data which have been presented in the reports of previous years are presented in this 1947 report.

Figures given in former reports to show average quantities based upon records since 1920, have been revised to show average quantities based upon more recent and more indicative years.

REPORT OF SACRAMENTO-SAN JOAQUIN WATER SUPERVISION FOR 1947

SACRAMENTO-SAN JOAQUIN WATER SUPERVISION

Water supervision activities, resulting from the efforts of the first Sacramento-San Joaquin River Problems Conference and its Permanent Committee working with the former Division of Water Rights, were inaugurated in 1924. A complete description of the origin, history and conduct of the work is found in the 1924 and 1926 Biennial Reports of the former Division of Water Rights, in Bulletin Number 4 of that Division, and in Bulletin Number 23 of the succeeding Division of Water Resources. The latter bulletin brings together all data and measurements obtained in the first five-year period, 1924 to 1928, inclusive. Annual Water Supervision reports for subsequent years are in separately bound books similar to this report.

Objectives

At the outset, the objective of the work of Water Supervision in the valley floor areas along the Sacramento and San Joaquin river system was to afford relief to water users from the difficulties of obtaining irrigation supplies occasioned by uncoordinated diversions during years of substantially subnormal runoff. The situation called for a voluntary regulation of diversions in order to alleviate as far as possible the damage from the serious shortages in the water supplies needed for irrigation, municipal consumption, salinity control in the Sacramento-San Joaquin Delta, and navigation purposes. Equitable coordination of diversions was accomplished primarily through the Water Supervision program.

There is no agreement between the water users under which a watermaster might distribute the natural water supply equitably to those entitled to receive it, but it appears inevitable that such an agreement, embracing a definite schedule of relative water rights, will be developed. Its realization will require, however, reliable data, covering a long period of years, on the actual diversions and uses of water, stream flows, stream accretions and salinity encroachment into the Sacramento-San Joaquin Delta. Looking toward that end, it has been the objective of the Division of Water Resources through its Water Supervision work, to collect and record all of the basic hydrographic data necessary to formulate an intelligent and practicable agreement defining the respective water rights of the parties affected in the area covered.

Scope of Work

The area embraced by the Sacramento-San Joaquin Water Supervision work lies on the Sacramento and San Joaquin valley floors. It specifically covers all of the lands irrigated from the Sacramento River between Redding and Sacramento, including those irrigated from the Colusa Trough, Back Borrow Pit, Knights Landing Ridge Cut, and Yolo By-Pass above West Sacramento, from Lower Butte Creek and Butte Slough, from the Feather River below Oroville, from the Yuba River below Smartville, from the Sutter By-Pass and Sacramento Slough, from the American River below Fairoaks, from the San Joaquin River between Fremont Ford Bridge (Stevinson-Gustine Highway) and Mossdale Bridge, from the Merced River below Snelling, from the Tuolumne River below La Grange, and from the

Stanislaus River below Knights Ferry, and the irrigated areas lying on the "uplands" side of and receiving water from the San Joaquin River between Mossdale Bridge and Stockton, Old San Joaquin River and Tom Paine Slough. The cooperative activities of the U. S. Bureau of Reclamation during 1947 make it possible to increase the area covered by data in this report to include the lands along the San Joaquin River upstream from Fremont Ford Bridge to Friant. The area covered and its geographical relation to the Central Valley Drainage Basin are shown on Plate 1.

Water Supervision Activities

The work of the Sacramento-San Joaquin Water Supervision unit of the Division of Water Resources is divided into two portions, field work, mainly during the spring, summer and fall months, and office work during the winter and early spring months.

The field activities include:

(1) Measurement of stream flow passing the many recording stations along the river and drainage channels;

(2) Measurements of the amounts of water diverted and collection of records of use by each water user;

(3) Measurements of the amounts of water returned to natural channels, through drainage plants or gravity drains, for possible re-use;

(4) Obtaining an annual census of irrigated acreages and crops supplied by either a primary, or drainage water supply, or both;

(5) Cooperation with and assistance to water users in connection with individual problems of diversion; and

(6) Assistance with hydrographic activities of cooperating public and private agencies.

The office work comprises mainly the assembly, computation and analysis of hydrographic and other data collected during the field season for presentation in the annual report of Water Supervision. This report contains the basic records of water supply available to, and the use of water by, each user of water from the streams covered in the area. The computation of stream flow, drainage and accretions involves the conversion of the recorded daily gage records to figures showing the daily flows in second feet and monthly runoffs in acre-feet. The computation of the amounts of water diverted by each water user involves the reduction of data showing the operation of his diversion plant, its electric power consumption, and its efficiency. The results of these computations are then compiled in the tabulations in this report for the purpose of giving basic records that are readily usable by all interested parties. The office work also includes the preparation of certain hydrographic data in form to be used as a guide in the ensuing season's field work.

Hydrographic Activities of Cooperating Agencies

The United States Geologic Survey, Water Resources Branch, through continued cooperative agreements with the Division of Water Resources, has maintained a series of stream gaging stations in the Sacramento and San Joaquin valleys. Some of the work of obtaining data from these stations is done by one of its engineers who works out of Sacramento, utilizing the office facilities of the Division of Water Resources. Certain of the stream flow rating measurements and the office work of compiling the records have been conducted cooperatively by the Federal engineer and the State Water Supervision engineers.

The Modesto Irrigation District, the Oakdale Irrigation District, the South San Joaquin Irrigation District, and the Turlock Irrigation District in the San Joaquin Valley have cooperated with the Water Supervision engineers by assisting in the installation of certain recorder equipped stream gaging stations and are continuing to cooperate by operating the recording instruments at those stations.

The City of San Francisco Public Utilities Commission, Hetch Hetchy Water Supply, has continued to cooperate with the Water Supervision engineers by maintaining, operating and compiling records from a series of stream gaging stations on the San Joaquin and Tuolumne rivers in the San Joaquin Valley.

The United States Bureau of Reclamation, through its offices at Sacramento, Colusa, Chico, Modesto and Merced, has cooperated by operating certain recorder equipped stream gaging stations, by furnishing records of flow at certain stations, by making stream flow rating measurements and by measuring the quantities of water diverted by many of the pumping plants along the main stream of the Sacramento and San Joaquin rivers. Since 1945, work of the State Water Supervision engineers has included furnishing to the Bureau current monthly preliminary estimates of flow and diversion quantities along the Sacramento River as affected by releases from Shasta Reservoir, and along the San Joaquin River as affected by releases from Friant Reservoir (Millerton Lake). This additional cooperation has necessitated monthly conferences at the Bureau's field offices between its engineers and State Water Supervision engineers in order to preliminarily compute the monthly diversions.

The final computations of the diversion quantities, as shown in this report, are the result of giving full consideration to all measurements and records of operation during the entire season for each individual diversion.

The specific degree of cooperation by these agencies with the Water Supervision engineers is detailed in footnotes on the many stream flow tabulations contained in this report.

SHASTA AND FRIANT RESERVOIR OPERATIONS

Shasta Reservoir on the Sacramento River above Redding was first used to store water for irrigation use during the winter of 1943-44 and releases for supplemental irrigation water along the Sacramento River commenced in the late spring of 1944. The release of water from the reservoir during 1944, 1945, 1946 and 1947 changed substantially the natural regimen of flow of the Sacramento River and in many respects greatly benefited conditions along that stream. However, it also has created added diversion problems.

Friant Reservoir on the San Joaquin River near Friant was first used to store water for irrigation use during the winter and spring of 1943-44 and the first releases for supplemental irrigation water occurred during 1944. Releases were made during 1947 for regulating and supplementing the irrigation supplies along the San Joaquin River.

The operations of the Shasta and Friant reservoirs are directed by the United States Bureau of Reclamation.

Reservoir Data

Shasta Reservoir is created by a gravity concrete dam, 500 feet high above low water level, located 13 miles upstream from Redding. The ultimate gross capacity of the

reservoir with spillway gates installed is 4,500,000 acre-feet, of which a space of 4,000,000 acre-feet will be available for the active storage of water and 500,000 acre-feet of space will be reserved for silt deposits and to create head for the generation of power. The spillway steel drum gates had not been installed in 1947 and the capacity of the reservoir to the fixed lip of the spillway was only 3,714,000 acre-feet. The ultimate storage capacity will be filled every year when the natural stream runoff from above the dam is equal to or exceeds the normal amount. Water from the reservoir is conveyed from the Sacramento Valley in the channel of the Sacramento River.

Friant Reservoir, on the San Joaquin River, is created by a gravity concrete dam 274 feet high above low water level, and is located at the base of the foothills about 20 miles northeast of Fresno. The ultimate gross capacity of the reservoir with spillway gates installed, is 520,000 acre-feet, of which a space of 404,000 acre-feet between the top of the spillway gates at elevation 578 and the bottom of the Friant-Kern Canal outlet at elevation 459.4 feet will be available for the storage of water for flood control and to supply irrigation demands in the San Joaquin Valley. It is planned to ultimately convey the major portion of the water from Friant Reservoir through the Madera and Friant-Kern canals to lands north and south of the San Joaquin River in Madera, Fresno, Kings, Tulare and Kern counties. During 1947, however, the spillway gates on Friant Dam had not been completely installed so the capacity of Friant Reservoir available for the storage of water for irrigation was the 350,000 acre-feet of space between the fixed crest of the spillway at elevation 560 feet and the bottom of the Madera Canal outlets at elevation 442.2 feet. The Friant-Kern Canal was in course of construction during 1947 and no water was diverted through it.

Shasta Reservoir Operation - 1947

The Shasta Reservoir has been constructed as a multi-purpose project. It is designed to furnish water for (1) irrigation in the Sacramento and San Joaquin valleys, including the Sacramento-San Joaquin Delta area; (2) salinity control in the Delta by maintaining a flow in the lower Sacramento River sufficient to repel the intrusion of salt water from Suisun Bay; (3) navigation on the Sacramento River above Sacramento to Chico Landing; and (4) the generation of hydro-electric power. The reservoir will also be used to control floods in the Sacramento River originating above Shasta Dam.

Although the storage of water in the reservoir commenced in the early part of the winter of 1943-1944, the ensuing season's subnormal runoff into it was not sufficient to completely fill the reservoir. However, the United States Bureau of Reclamation was able to release sufficient stored water throughout the irrigation season of 1944 to augment the natural stream flows and thereby facilitate diversions of those natural flows by the diverters along the Sacramento River.

Since 1944, including 1947, the quantity of water in storage in Shasta Reservoir was sufficient to afford releases (1) to facilitate irrigation diversions by maintaining higher river levels along the Sacramento River, (2) to sustain minimum flow for navigation of approximately 5000 second feet upstream from Knights Landing, (3) to supplement irrigation supplies in the Delta area below Sacramento, and (4) to control salinity. During 1947, a year of 54 percent of normal runoff to the Delta, releases from the reservoir were regulated to maintain a stream flow out of the Delta into Suisun Bay sufficient to hold back the line of excess saline concentration to an arc embracing only 32,400 acres of the lower Delta area.

The daily total mean second feet flows of all streams flowing into Shasta Reservoir during 1947 are given in Table 6. This inflow to the reservoir, as shown by the daily figures, represents the amount of water that would have been flowing in the Sacramento River at the dam site if the dam had not been built. The inflow figures are computed by combining the effects of daily change in storage, reservoir evaporation, releases and spill.

A tabulation of the daily amounts of water in storage in Shasta Reservoir during 1947 is given in Table 7. The daily mean-second-foot-flows as measured below Shasta Dam at the United States Geological Survey station near Keswick are given in Table 8. The flows at the Keswick station are the same as the releases from Shasta Reservoir except for the amounts of inflow between the station and Shasta Dam. The amounts of this inflow are small during the irrigation season, and can be ignored, so that the flows at the gaging station can be assumed the same as the releases from the reservoir during that period.

A chart depicting the operation of Shasta Reservoir for 1947, as prepared by the U. S. Bureau of Reclamation, giving the inflows to the reservoir, the amounts released, the water surface elevations and the amounts of water in storage, is shown on Plate 2.

Friant Reservoir Operation - 1947

The Friant Reservoir will be used only for the storage of water for flood control and irrigation purposes. The daily total mean-second-foot-inflows to Friant Reservoir during 1947 are given in Table 62. A tabulation of the daily amounts of water in storage in the reservoir during 1947 is given in Table 63. The daily mean-second-foot-flows, as measured at the United States Geological Survey gaging station below Friant, are given in Table 64. These flows are the same as the releases from Friant Reservoir except for the amounts of inflow between the station and Friant Dam. The amounts of this intermediate inflow are small during the irrigation season so that the measured flows at the gaging station are practically the same as the releases from the reservoir during that period. A chart depicting the operation of Friant Reservoir for 1947, as prepared by the U. S. Bureau of Reclamation, giving the same data as are shown by the chart for Shasta Reservoir, is also shown on Plate 2.

During the 1947 irrigation season water stored in Friant Reservoir (Millerton Lake) was released both into the Madera Canal and into the channel of the San Joaquin River. Diversions by the Madera Canal served largely to aid in the replenishment of ground water supplies in the Madera area. The regulated releases flowing down the San Joaquin River served not only the irrigation requirements of the lands along that stream above the head of the Gravelly Ford Canal, but also the requirements of the numerous diversions below that point to Temple Slough.

RUNOFF AND WATER SUPPLY

The variable flows of the streams entering the Sacramento and San Joaquin valleys on the north and east sides result from the rainfall runoff occurring each winter and spring season principally from December to April, the snow melt runoff occurring during the spring and summer seasons from March through June, and a combination of runoff from perennial springs and released stored water during the summer and fall seasons. Flood flows in the valley floor channels are caused by runoffs from rainfall and melting snow in the mountain areas in excess of mountain reservoir capacities, and by rain storm runoff from the vast area of minor foothill watersheds and valley floor lands. Some

incidental flood control is accomplished by reservoirs in many of the tributary watersheds including those of the Sacramento, Feather, Yuba, Stanislaus, Tuolumne, Merced and San Joaquin rivers. The extent of the flood flows in 1947 is given by the accompanying tabulations of daily stream flows.

During the summer irrigation season, variations in flow of the streams on the valley floor are affected, (1) by the combination of diversions from the streams for irrigation and of accretions to the streams from both direct surface drainage and seepage from ground water, and (2) by releases of stored water for irrigation, navigation, salinity control and the generation of electric power.

1947 Inventory of Runoff

A comprehensive summary and inventory of the monthly stream flows, diversions and accretions, in acre-feet, is contained in Tables 2 and 3. This inventory is arranged to give these data for each reach of each stream covered by Water Supervision work in a summarized ready-reference form. The inventory is designed to give a picture of the complete disposition of the season's water supply.

1947 Runoff Comparisons

A comparison of the full natural runoffs in percent of a 50-year normal for the period 1920-1947, in the major streams tributary to the Sacramento and San Joaquin valleys is given in Table 1. As shown in that table, the 1947 natural runoff may be summarized as follows:

Stream and Station	Percentage of 50-year normal
Sacramento River at Red Bluff	58 percent
Sacramento River at Sacramento	54 percent
San Joaquin River at Friant	59 percent
San Joaquin River at Vernalis	55 percent
Sacramento and San Joaquin rivers flow to the Delta	54 percent

A comparison of the season's actual minimum flows is given in Table 131. The mimimum 10-day flows during 1947 are shown to have been:

Stream and Station	Average minimum 10-day flow
Sacramento River at Sacramento	4700 second feet
San Joaquin River at Vernalis	477 second feet
Combined Sacramento and San Joaquin rivers flow to the Delta	5270 second feet

It is apparent from these comparisons that the water supply available in the 1947 season was substantially subnormal. Observations of water utilization and the amounts of residual flows in the streams reaching the Delta in 1947 indicated that the demands for irrigation and salinity control exceeded the natural flow supplies, and the releases of stored water from Shasta Reservoir were of primary importance in maintaining satisfactory river flows and fresh water conditions in the Delta.

Primary Irrigation Supplies

The flows onto the valley floor during the summer season through the major streams are considered to be the primary water supplies for irrigation. This primary water is differentiated from the flows available for irrigation in the lower reaches of the streams resulting from large accretions including the return of a substantial amount, through drainage, of the flows diverted for irrigation upstream. The amounts of primary water available for irrigation in the Sacramento Valley are given in the flow tabulations for

those gaging stations located at the edge of the valley floor, to wit, tables numbered 8, 39, 44, 45, 52 and 56.

In the San Joaquin River service area, primary water supplies are almost entirely diverted from the upper reaches of the Stanislaus, Tuolumne and Merced rivers by the large irrigation districts, and from the San Joaquin River in the vicinity of Mendota by the large canal companies. These upper diversion points on the Stanislaus, Tuolumne and Merced rivers are above the upstream gaging stations considered in this report. However, the amounts of the diversions by the large irrigation districts along the east side of the valley are given in Tables 109, 110, and 111. Primary water supplies in the San Joaquin River for irrigation below Friant are measured by the San Joaquin River gaging station below Friant, Table 64.

Accretions to Stream Flow

As evidenced by the data for stream flow and diversions, summarized in Tables 2 and 3, there are large quantities of accretions to the flows of the streams and channels in their courses across the valley floors. These accretions are of major importance as available irrigation supplies. They are made up of measured flows from surface drains and of many other flows, not susceptible to direct measurement, from minor ephemeral streams, from scores of small surface drains, from seepage and return of percolated irrigation water and from escaping underground water normally present as the result of percolated rainfall on the valley floor.

During the summer season a large portion of the accrete water is derived from upstream irrigation returning to the streams either as surface drainage or waste into open drains or as deep percolation to the ground water from which it finds its way to nearby streams or drains.

Throughout the year, along certain reaches of the streams, the flows are augmented by outflows from seepage of the natural ground water. This portion of the ground water, which is independent of irrigation as a source, is replenished from two other sources, (1) rainfall on the valley floor, a portion of which percolates to the water table during periods of abundant precipitation, and (2) infiltration and escape from stream channels through the banks during high flood flow conditions, later to partially return to that stream when its water levels recede to low flow conditions of the summer and fall.

The figures shown in all previous reports, giving the relation of "return water in percent of diversion" as discussed under heading "Drainage and Return Water", may be misleading inasmuch as all accretions, heretofore referred to as "return water", actually may include substantial amounts of ground water seepage not derived from upstream irrigation and unmeasured contributions from small tributaries.

Sacramento Valley Accretions. In the Sacramento Valley all of the accretions to natural and regulated flows which are not diverted on lands north and west of the Sacramento Delta flow into the Delta and are available for use in that area. Practically all of the summer accrete flows in Colusa Trough, Back Borrow Pit, Knights Landing Ridge Cut, and Yolo By-Pass are mainly return waters derived from diversions from the Sacramento River. Since the Sacramento River is the main stream through the Sacramento Valley the accretions to that stream include substantial amounts of return water from irrigated areas served by water from other sources, particularly the Feather River. A large part of the summer return water flows reaching the Sacramento River through the Butte Slough

Outfall Gates (Mile 84.0L) and from Sutter By-Pass through Sacramento Slough (Mile 21.2L) are of Feather River origin. However, the measured flows in Sacramento Slough, Table 38, include not only return water from Feather River diversions but also return water from Sacramento River diversions into Reclamation District No. 1500, Table 37. In previous Water Supervision reports estimates are given showing that bank seepage into the West Borrow Pit of the Sutter By-Pass from R.D. 1500 amounts to 10 per cent of that district's diversions from the Sacramento River.

Along the Sacramento River between Colusa and Red Bluff there are no large well defined artificial drainage channels. Records or estimates of natural inflow to the Sacramento River from streams in this stretch were, however, obtained where available. Above Red Bluff to Redding there is considerable drainage water from the Anderson-Cottonwood Irrigation District, but is not recorded as such.

Along the Feather River, during years of subnormal water supply, practically all of the primary regulated water is diverted upstream from, or at, the Sutter-Butte diversion dam, yet accretions accumulate below that point in amounts sufficient to afford a limited supply for all diversions.

Table 2 is designed to give a summary not only of monthly flows measured on the Sacramento Valley floor but also the computed monthly amounts of accretions (or losses, as shown by a minus sign preceding the figure) occurring along each reach of each stream between gaging stations. At the end of each series of data for one stream, as shown in Table 2, there are summations of diversion and accretion quantities.

In order to compare 1947 season conditions along the Sacramento River with those of previous years, the following tabulation gives the seasonal accretions, July through September, in per cent of simultaneous diversions. This tabulation, in part, is excerpted from Table 147 in the 1946 Water Supervision Report. The figure for 1947 is derived from the summation data in Table 2, accompanying this report, but under the same provisions detailed in the "note" under the 1946 Table 147.

Comparative Seasonal Accretion Percentages - 1938-1947

Sacramento River - Red Bluff to Sacramento

Year	Seasonal Runoff at Red Bluff in per cent of 50-year Normal	Accretions in per cent of Diversions* July through September
1938	168	64
1939	50	36
1940	120	40
1941	164	56
1942	129	56
1943	97	53
1944	53	49
1945	76	43
1946	92	51
1947	58	52

*Excludes City of Sacramento municipal.

It is apparent from the above tabulation that there are variations in the accretion percentages with relation to the seasonal runoffs. However, a definite trend in this relation indicates that summer accretions to stream flow on the Sacramento Valley floor are influenced not only by return water from irrigation but also by natural ground water seepage.

San Joaquin Valley Accretions. The summer and fall season stream flows in the lower San Joaquin River and its tributaries on the valley floor consist mainly of accrete flows derived to a large extent, from irrigation water returning to the stream channels by way of percolation into the groundwater and the latter's seepage into the channels. The exceptions to this condition are on the Tuolumne and Stanislaus rivers when irregular releases for power generation below upstream diversion points further augment the flows.

The channels of the Stanislaus, Tuolumne and Merced rivers in their westward flow across the valley floor from the foothills are in deep degraded canyons between more or less sheer bluffs rising from 10 to 50 feet to the predominant level of the upper plains of the valley floor. The plains areas are intensively irrigated with regulated gravity water supplies derived from the upper reaches of the same streams. Thus, an abundant water supply in normal years, a deep and permeable soil and the deep river channels are all conducive to relatively steep slopes of the groundwater table toward the rivers and the consequent high rate per mile of accretions to the stream flow.

The magnitude and importance of these accrete waters in the San Joaquin Valley as a water supply is brought out in Table 3. There does not appear to be as definite a relation of accretions to diversions along these San Joaquin Valley streams as exists in the Sacramento Valley. This lack of a relation may be due, (1) to the considerable lag between the time diversions are made from the streams for storage in terminal reservoirs (Woodward, Dallas-Warner, and Owens) and the time a portion of those waters return to the stream channels after having been applied for irrigation, and (2) to the prevailing climatic effects upon rainfall, humidity, transpiration and evaporation.

The ratio of accretion (including return water from irrigation) to diversions along the lower San Joaquin River and its tributaries, Stanislaus, Tuolumne and Merced rivers, is considerably smaller than that for the Sacramento River. Analysis of pertinent data in Table 3 and comparison with the data contained in Table 147 of the 1946 Water Supervision Report indicate this San Joaquin Valley ratio to vary between 19 and 35 percent while the foregoing table on page 24 shows the Sacramento Valley ratio to vary between 36 and 64 percent. This difference may be attributed to the fact that, whereas, due to basin topography and geology, practically all drainage from the Sacramento River diversions is quickly returned to the river, considerable of the return water in the San Joaquin Valley may never reach the surface streams because of its percolation to ground water and its immediate recovery by drainage and deep well pumps in the areas of many of the irrigation districts for re-use through the irrigation canals.

Stream Flow Measurements

Many of the stream gaging stations, the records from which are reported herein, are maintained, operated and rated, and the flows at them are computed, by agencies cooperating with the work of the Sacramento-San Joaquin Water Supervision. The methods used by all cooperating parties are standardized and the results obtained are equally good. In order to obtain uniformity, however, the Water Supervision engineers cooperate with the other agencies in obtaining and correlating the records for each of the cooperative stations.

Approximately one-half of the gaging stations on streams and drainage channels for which records are reported herein are maintained, operated and rated, and the flows at them are computed, solely by the Division of Water Resources through the Water Supervision and Flood Control organizations.

An automatic water stage recorder is in operation at each of the gaging stations used in this work. The continuous records of water surface elevations at the stations serve two major purposes in the preparation of the data presented in this report. First, the actual water surface elevations at two adjacent stations on a stream afford the means of obtaining the water surface elevations at the pumping plants along the stream between those stations. These elevations give the pumping heads, which heads, in turn, become factors in determining the rates of diversion by the pumping plants. Second, the water surface elevation (gage height) is a factor in determining the flow of the stream, in second feet, passing the station.

A stream flow rating is made for each gaging station. This rating gives the flows in second feet for each gage height at the station. Normally this gage height-flow relation, or rating, is more or less permanent where there is a fixed channel and flow regimen at the station. The rating varies however where the bed of the channel is of loose shifting sand, or heavy weed growth accumulates as the season progresses, or where there may be backwater effects from downstream conditions. In this latter case more frequent measurements of flow are made to obtain accurate records of the flows passing the stations.

Water surface elevations at certain gaging stations at any time may be derived by the reader by using Table 5 coupled with the stream flow data in Tables 8 to 91, inclusive. From the stream flow table the flow on any desired day is interpolated into the specific station's rating table in Table 5 to give a gage height (or elevation) of the stream's water surface for that day.

Preliminary Data from Cooperating Agencies

Some of the stream flow records submitted by cooperating agencies and included in this report must be considered "Preliminary Data" since this report is published prior to final preparation of the data for publication by those agencies. This condition is particularly true with respect to some data furnished by the U. S. Geological Survey.

Stream Flow Bulletins

During 1947, stream flow bulletins were compiled from time to time and mailed to interested agencies and persons. The bulletins listed the results of stream flow current meter measurements made along the Sacramento and San Joaquin river system on the valley floor by Division of Water Resources (Sacramento-San Joaquin Water Supervision) and U. S. Geological Survey engineers.

Notes on Certain Gaging Stations

Records are obtained and published in this report for 86 gaging stations in the Sacramento and San Joaquin valleys. A brief description of each station is given at the bottom of the stream flow data table. The location of each station is shown on Plate 3 in the pocket on the back cover of this report. Additional notes on one of the stations are believed desirable, however, for a better understanding of the records. These notes are as follows:

Sacramento River at Sacramento. The method of computing daily mean flows at this station for 1947 has been radically changed. Heretofore, as shown in previous reports, the low flows which are affected by tidal action, were derived from (1) the records of flows at Verona on the Sacramento River and at H Street Bridge on the American River and (2) records of diversions from and drainage to the rivers between those two upper stations and the I Street Bridge at Sacramento. The method previously used did not

take into account unmeasured accretions or losses in the reach between Verona and I Street Bridge and in the American River below H Street.

The procedure employed in 1947 involves the computation of daily mean Sacramento River flows passing Sacramento by the usual and standard practice of rating the stream, at the I Street Bridge station by means of the slope-velocity method. This method requires a consideration of the gage heights recorded at the river gaging station at Snodgrass Slough (20 miles downstream from Sacramento) as well as the recorded gage heights at Sacramento. The adaptation of this method as a means of direct rating, was accepted after Water Supervision engineers had measured and studied the problem with this method in mind for the past three years.

The final relation for tidal influenced flow conditions at Sacramento involves the construction of a rating curve having as the ordinate the difference between the gage heights at Sacramento and at Snodgrass Slough and as the abscissa a function of velocity (fV) equalling the discharge (Q) divided by the gage height at Sacramento. Flows, in second feet, passing Sacramento are obtained from this relation by multiplying the scale value of fV for any differential gage height, by the corresponding gage height at the I Street recorder. This relation is used for gage heights at Sacramento below 10.5 feet (a flow of 33,000 second feet) below which tidal fluctuations are effective.

The flows for gage heights above 10.5 feet follow the simple exponential relation

$$Q = 435 \times (\text{I Street Recorder G.H.} + 7.40)^{3/2},$$

since tidal fluctuations cease, and a straight flow-stage relation exists.

Channel dredging activities by the U. S. Corps of Engineers in the vicinity of Sacramento during two years prior to 1947 caused a substantial shift in the flow-stage relationship in those years, but frequent flow measurements, including tidal cycle measurements, made during 1947 delimit the above relationships.

Automatic Radio Stream Gage Transmission

For purposes of receiving immediate and current information on flood flows in the winter and spring, and the variations of summer water supplies at critical stations, the Division of Water Resources has maintained for many years a system of automatic radio transmission of gage heights. The radio signals indicating the gage heights are received at Sacramento headquarters office of the Division through a permanent receiver, or at desired points in the valley through portable receivers. The stream gaging stations which are equipped with automatic radio gage height transmitters are, Sacramento River near Red Bluff, Sacramento River at Ord Ferry, Sacramento River at Colusa, Sacramento River at Fremont Weir, Feather River near Oroville, South Fork American River at Coloma, North Fork American River at Rattlesnake Bridge and San Joaquin River near Vernalis. The instantaneous stream flow information thus received is not only of value to the Water Supervision and Flood Control work of the Division but it is relayed immediately to interested agencies including the United States Bureau of Reclamation, United States Weather Bureau, and United States Corps of Engineers, and made public daily through the press.

Precipitation

In the Central Valley of California direct precipitation is a negligible source of water supply for growing crops during the late spring, summer and fall seasons. During the early irrigating season, however, the attendant cooler temperatures and higher humidities of rain storms substantially reduce the demand for irrigation diversions, and are

two of the main factors affecting the variations in demand in the same month from year to year.

The following tabulation gives the 1947 monthly total precipitation at representative valley floor rainfall stations and the monthly normals. Records are from U. S. Weather Bureau.

Station	Inches of Precipitation												
	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Annual
Red Bluff - 1947	0.53	2.30	2.62	1.94	0.87	0.66	T	0.02	0.15	3.90	0.89	1.69	15.57
- normal	4.76	3.92	3.25	1.70	1.13	0.47	0.03	0.05	0.80	1.33	2.97	4.40	24.81
Colusa - 1947	0.05	2.78	2.00	0.38	0.88	0.60	0	0	0	2.20	0.99	1.25	11.13

Merced - 1947	0.40	0.76	1.00	0.51	0.11	0.12	0	0	0.01	1.21	0.91	0.47	5.50
- normal	2.30	1.91	1.87	1.01	0.48	0.11	0.01	0.02	0.18	0.49	1.17	1.80	11.35
Fresno - 1947	0.20	0.60	0.46	0.41	0.20	0.02	T	T	T	0.81	0.43	0.42	3.55
- normal	1.73	1.43	1.58	0.95	0.44	0.08	0.01	0.01	0.21	0.57	0.93	1.45	9.39

It can be seen from these data that Central Valley floor precipitation averaged 60 percent of normal for the 1947 season.

USE OF WATER FOR IRRIGATION

The prevailing warm temperatures and a prolonged frost-free period during the summer season in the Sacramento and San Joaquin valleys favors the profitable production of a wide variety of marketable crops in large quantities. The availability of irrigation water during the dry summer season affords continuous growing conditions necessary for the many crops.

The major irrigated crops in the Sacramento Valley include rice, alfalfa and clover, citrus and orchard fruits, nuts, grapes, hops, truck crops, and field crops; in the Delta area they include alfalfa, orchard fruits, corn and truck crops; and in the San Joaquin River and tributaries service area they include grapes, nuts, orchard fruits, cotton, alfalfa and clover, truck crops, corn, grain, flax and pasture.

Irrigation Diversions

Measurements and records of diversions in 1947 have included all of the points of diversion on the valley floor along the Sacramento River and its tributaries; along the upland banks of the delta channels of Old San Joaquin River, Tom Paine Slough and San Joaquin River; along the Stanislaus, Tuolumne and Merced rivers, below the major irrigation districts' upstream gravity diversions; and along the San Joaquin River between Friant Dam and Durham Ferry Bridge (Vernalis).

This report contains records of a total of 841 points of diversion segregated as to various sources as follows: Sacramento River 288, Colusa Trough (above Colusa-Williams Highway crossing) 24, Back Borrow pit (extension of Colusa Trough along back levees of Reclamation Districts 108 and 787) 22, Knights Landing Ridge Cut 11, Yolo By-Pass 11, Lower Butte Creek and Butte Slough 33, Sutter By-Pass and Sacramento Slough 39, Feather River 42, Yuba River 13, American River 32, Old San Joaquin River 17, Tom Paine Slough 9,

San Joaquin River (below Vernalis gaging station) 61, San Joaquin River (between Vernalis gaging station and Fremont Ford Bridge) 20, San Joaquin River (between Fremont Ford Bridge and Friant Dam)109; Fresno Slough and Fresno Slough By-Pass 9 , Merced River 59, Tuolumne River 19, and Stanislaus River 23. The location of these points of diversion are shown on Plate 3 in the pocket at the back of this report.

All of the diversions, except 30 by gravity, are accomplished by pumping. The records of diversion by gravity are obtained by means of canal ratings established by flow measurements. In the case of the pumping diversions there are a few instances where the records are obtained by means of canal ratings but in the main the records are obtained from a relation established between electric power consumption, static head and plant efficiency. This is made possible by the fact that nearly all of the pumping plants are electrically operated. The relation between water pumped and power input is determined from current meter measurements of the discharge and the measured kilowatt input. At the larger pumping plants several measurements are made during each season. At the smaller plants a number of measurements are made initially to determine the ratings and thereafter measurements are made at invervals to discover any changes which may occur in the ratings. Due to the intermittent operation of the smaller plants and the large area to be covered by the field engineers, it is not possible to make many discharge measurements at any one of them. However, it is believed that the rating, as initially determined, remains more or less constant and that over a period of time enough measurements are secured to determine any change in the rating. All rating measurements made by owners or cooperating agencies have been given full consideration in the final computations of the amounts of water diverted by each individual plant.

Prior to 1933 a daily diversion record for each plant was compiled. However, since that year, except for some of the larger plants, the monthly diversion records only are available. The diversions for 1947 have been computed on a monthly basis only, and the breakdown into daily records was not made. The monthly amounts of water diverted at the individual points of diversion along all of the streams covered by the Water Supervision work are given in Table 93 through 111.

The records of diversions from the upper San Joaquin River and from Fresno Slough and Fresno Slough By-Pass are continued in this report for 1947. Table 107 gives diversions along the main stem of the San Joaquin River between Fremont Ford and Friant and Table 108 gives the diversions from Fresno Slough and Fresno Slough By-Pass. Fresno Slough and Fresno Slough By-Pass normally convey excess Kings River water flood flows into the San Joaquin River at a point above Mendota Dam, but during the irrigation season San Joaquin River water is backed up through those channels by the Mendota Dam to afford irrigation supplies to the James and Tranquillity irrigation districts and to certain other diverters. The data in Tables 107 and 108 were furnished by the U. S. Bureau of Reclamation. The field activities of the Sacramento-San Joaquin Water Supervision work did not include upper San Joaquin River observations except to become acquainted with the general problems involved.

A seasonal summary of water utilization during the past seven years, 1939 through 1947, from the Sacramento River and its tributaries and the San Joaquin River and its tributaries is shown in Table 92. This table presents an overall picture of the water utilization in these areas.

Table 125 shows a comparison of the acreage of rice irrigated during the period 1924 through 1947 from the stream channels within the Sacramento and San Joaquin valleys which are covered by Water Supervision work, and the total acreage of rice in California irrigated from all sources as reported by the Federal-State Crop Reporting Service. In Table 112 there are shown the average monthly diversions in percent of the seasonal for the streams in the Sacramento and San Joaquin valleys. A summary of the monthly diversions from the Sacramento and San Joaquin valley streams for the seven-year period of record prior to 1947 is given in Tables 113 through 123. Table 124 shows, for the Sacramento River only, the seasonal diversions and acreages irrigated for the period 1939 through 1947, segregated to the different river sections.

On about July 1, 1947, the Banta-Carbona Irrigation District constructed a temporary dam of earth filled sacks across the San Joaquin River 50 feet below its intake canal. The prevailing low flow conditions of the river at that point allowed the tidal fluctuations full sway at the district's pumping plant causing serious loss of pumping capacity and damage to the plant. The dam held the river water upstream at the average high tide level thereby maintaining approximately a 2.5 feet higher water level at the plant. The prevailing low flows in the river were allowed to pass over the sack dam at specially prepared sections. Similar temporary dams have been placed at this site during other years of low flow since 1924.

Irrigated Acreage

Toward the end of the irrigating season in 1947, as was done in previous years, a complete canvass was made of acreages irrigated from each of the points of diversion covered by the Water Supervision work. The irrigated acreage for all of the points of diversion on the streams north of Durham Ferry Bridge (Vernalis) on the San Joaquin River, including the Sacramento Valley floor streams, was plotted on suitable maps and are retained on file in the office of the Division of Water Resources for record.

The area irrigated through each individual point of diversion along the streams covered in this work is given in Tables 93 to 111, inclusive. These tabulations and the associated summarizing tables do not include data on diversions and use of water in the Delta.

The following is a summary of the total acreage irrigated during 1947 in the area covered by the Water Supervision work. A comparison of annual total acreage irrigated, 1939 through 1947, is given in Table 4. Detailed acreage tabulations are found in Tables 92 through 111.

Area	1947 Irrigated Acreage	
Sacramento Valley Floor above Sacramento	382,600	
San Joaquin Valley Floor above Delta	496,400	
Total area served by measured diversions		879,000
Sacramento-San Joaquin Delta		
Cropped	336,000	
Water and native plants	113,000	
Total Delta		449,000
Grand Total		1,328,000

In view of the methods of farming, which usually employ rotation of crops with summer-fallow, it is probable that the acreage of land under irrigation facilities in the area covered by the Water Supervision activities approaches 1,400,000 acres.

Gross Duty of Water

The term "gross duty of water", as used in this report, is defined as being the total amount of water diverted to serve one acre of irrigated land. The gross duty for any particular period may be expressed as the amount of water diverted in acre-feet per acre irrigated, or, conversely stated, may be expressed as the number of acres irrigated per one second-foot average diversion rate. The gross duty of water does not include solely the net amount of water consumed by plants in their processes of transpiration and growth, but also includes all irrecoverable losses through evaporation and deep percolation, plus canal and conveyance losses, and those amounts of water which act as a necessary vehicle to carry irrigation heads across porous soils or to maintain fresh water ponds in the growing of rice and which return to some river or drainage channel, with little loss, to become available for re-use.

Gross duty of water figures for the individual stream channels covered by Water Supervision work are given for the Sacramento and San Joaquin valleys in Table 92.

Use of Water in Delta

Previous Water Supervision annual reports have included considerable analyses of the utilization of water in the Sacramento-San Joaquin Delta. The work of Water Supervision does not cover the delta area to the extent of measuring flows in the numerous interconnected channels or quantities of water diverted for irrigation, but, periodically, surveys have been made of crops and irrigated acreages. Special investigations of the Delta irrigation problems have been conducted and the results therefrom have been reported in previous reports.

In previous years, when the crop surveys were made, the total consumptive use of water has been segregated to show the use in each river delta. There was also shown a classification of the irrigated crops with respect to the peat and sedimentary soils on which they were produced.

SALINITY INVESTIGATIONS

The intrusion of salty water from San Francisco Bay into the channels of the Delta from which irrigation supplies are derived, is a matter of extreme importance and the Water Supervision work has included observations during 1947 of the saline content of the water at several stations throughout the Delta and upper San Francisco and Suisun Bay areas, with cooperation from the U. S. Bureau of Reclamation.

Purpose

The purpose of the salinity investigation, as outlined in previous reports, has been to record the occurrence and extent of salinity encroachment from San Francisco Bay, and to establish the relation between movement of salinity, stream flow to the Delta, and tidal action. As reported in Bulletin 27 of the Division of Water Resources, this relation was established for the conditions which obtained during the period of the special investigation for that bulletin and upon the basis of all data available at that time. Subsequent investigations, therefore, have been directed to the maintenance of an unbroken record of the salinity, tidal and stream flow variations, essential not only in the corroboration of the relation presently established, but as the basis for a check of possible modifications in the relation due to changes in channel and tidal conditions which may have taken place or will occur in the future. Also, during periods of low stream flow, the continuation of salinity sampling has been essential in keeping the Delta irrigators advised

of conditions through periodic bulletins so that damage from the use of water of too high salt content might be averted. (Saline concentrations exceeding 100 parts of chlorine per 100,000 parts of water are toxic to the average plant and are objectionable for human consumption.)

During 1947 the continuous observations of salinity served as an important factor in determining the amounts of release from Shasta Reservoir as controlled by the U. S. Bureau of Reclamation.

Scope

The general scope of this investigation each season has been such as to insure that samples of water to be tested for salinity could be taken at regular intervals at a sufficient number of stations throughout the Delta and upper Bay region so that the advance and retreat of the salinity from early summer to late fall would be completely recorded. Plate 4 shows the limit of encroachment into the Delta of water having 100 parts of chlorine per 100,000 parts of water for the years 1931, 1938, 1943, 1944, 1945, 1946 and 1947. These certain years are chosen, first, to represent a range of runoff conditions prior to the commencement of releases from Shasta Reservoir, to wit, 30 per cent of normal runoff during 1931, 170 per cent of normal runoff during 1938, 114 per cent of normal runoff during 1943, and second, to represent the consecutive years concurrent with those releases. The salinity encroachment lines for each of the years 1920 to 1944, inclusive, may be found on the Delta map in the 1944 annual Water Supervision Report.

Due to curtailment of appropriations to the Division of Water Resources by the Legislature in the 1941-1942 budget, sampling for salinity at all stations in the Bay and Delta areas was stopped by the Division of Water Resources on July 15, 1941. Through cooperation of the Fontana Farms Company, the City of Antioch Water Department, the U. S. Bureau of Reclamation, the Dow Chemical Company at Pittsburg and the City of San Francisco, miscellaneous samples were taken during the 1943 season and the results of the analyses are presented in the 1943 report of Water Supervision. In that same report there are tabulated a large number of complete analyses of water from the channels of the Sacramento and San Joaquin valleys and the Delta as prepared by the U. S. Bureau of Reclamation.

A regular program of salinity sampling and testing was re-established early in 1944 as part of the activities of the Sacramento-San Joaquin Water Supervision, with the necessary funds therefor being provided by the U. S. Bureau of Reclamation. This regular program was continued throughout 1947. The records of water samples taken during 1947 from 33 active sampling stations are given in Table 128.

Complete or Partial Analysis of Surface Flows

As a matter of record there is included in this report a tabulation of the results of complete or partial chemical analyses of samples of water taken at many points along the Sacramento and San Joaquin rivers and in the Delta during 1947. These results are contained in Table 132 and are furnished entirely by the U. S. Bureau of Reclamation. The methods of collecting the samples and of analysis are definitely different from the methods employed in determining the chlorine component as part of the regular salinity observation activities in the Sacramento-San Joaquin Delta. Although the records of the U. S. Bureau of Reclamation include results of complete or partial analysis at many points on streams in the Central Valley area this annual report gives results for only a limited series of river points which are indicative of the trend and the source of salt concentrations.

New Salinity Observation Stations

Construction work was started on the headworks of the Delta-Mendota Canal, a unit of the Central Valley Project, during 1947. Inflows to the Delta area from the San Joaquin River during 1947 decreased to less than 500 second feet in July. This low flow condition caused an accumulation of saline waters along the southwest edge of the Delta in Old River, and it became apparent that additional salinity observation stations surrounding the intake of the new canal were needed. Three new stations were established for this purpose: Clifton Court Ferry (re-established), South Fabian and Grant Line Canal Bridge.

Two other new stations were established, one immediately below the intake canal of Banta-Carbona Irrigation District and the other at the San Joaquin River Gaging Station near Vernalis (Durham Ferry Bridge). These new stations were established for the purpose of checking salinity in San Joaquin River water above the temporary diversion dam placed across that stream below the Banta-Carbona intake canal, in comparison to concentrations below the dam when tidal fluctuations were present.

A description of the location of each of these new stations is contained in Table 127, together with the descriptions of all other stations active during 1947.

Station Maintenance and Records

The salinity sampling at all stations is done by local observers. Each observer is provided with a schedule showing the exact time for taking the samples, so that, throughout the Delta and upper bays all samples are taken at approximately one and one-half hours after the same high tide at four-day intervals. Table 127 gives the location and description of each active station from which samples were received during 1947. Location description of inactive stations are deleted in this report but can be found in previous reports.

The observers are furnished with stamped containers for the sample bottles so that the latter can be mailed, as filled, to the laboratory at Sacramento. All analyses of the water were made at the Materials and Research Laboratory of the Division of Highways in Sacramento during the 1947 season.

The maximum salinity as recorded at the stations in 1947 is shown in Table 126. For comparative purposes, this table shows also the maximum salinity recorded at these stations in previous years beginning with 1937. Only presently indicative and active stations are included in this comparison.

Daily Salinity Observations

In compliance with the desire of the U. S. Bureau of Reclamation to obtain daily observations of salinity in the Suisun Bay area arrangements were made for daily observations with the U. S. Maritime Commission, Reserve Fleet Division, for the West Suisun station and with the U. S. Navy, Marine Barracks, for the Port Chicago station. Special schedules of daily times for taking salinity samples were prepared for each of the two stations and complete and satisfactory cooperation by the two agencies was experienced through the year. The special results of the daily observations were transmitted immediately to the U. S. Bureau of Reclamation as received from the State Testing Laboratory. The daily records at these two stations are given in Tables 129 and 130. However, the regular four-day interval results of observations for the two stations, West Suisun and Port Chicago, are included herein in Table 128 together with similar results for all other stations.

Salinity Bulletins

During 1947 a salinity bulletin was mailed each month to many interested agencies and individuals giving the results of samples taken and analyzed at four-day intervals at all of the stations. The figures given were the laboratory determination of the number of parts of chlorine per 100,000 parts of water.

Area of Salinity Encroachment

There is an apparent relation between the average stream flow to the Delta during the ten-day period of minimum flow and the area affected by salinity encroachment. Data amassed in this regard indicate that when the flow to the Delta drops below a certain amount the rate of advance of salinity encroachment greatly accelerates. A comparison of the average stream flows during the ten-day period of minimum flow and the affected acreage in the Delta is presented in Table 131.

TIDE GAGES

The 28 recording tide gages located on the Delta channels and on the upper bays were continued during 1947. Previous Water Supervision Reports contained detailed descriptions and locations of the gages. The Flood Control branch of the Division of Water Resources operates and maintains 18 of these tide gages. The remaining 10 are operated by Federal agencies.

(1) 50 year normal taken as 50 year (1889-1939) mean annual full natural runoff (Oct.-Sept. incl.).

(2) Summation of full natural runoff at foothill stations on major tributaries only, and does not include runoff from minor tributaries and from valley floor.

(1) Figures for General Crops include acreage flooded for gun clubs.
(2) Figures for General Crops include 2200 acres in Carmichael Irrigation District classed as irrigated suburban areas.
(3) Figures exclude acreage in Madera Irrigation District.
(4) Figures exclude acreage in Merced, Turlock, Modesto, Waterford, Oakdale and South Joaquin Irrigation Districts.

TABLE 5

RELATION OF GAGE HEIGHT TO STREAM FLOW - 1947 SEASON

SACRAMENTO-SAN JOAQUIN VALLEY STREAM GAGING STATIONS

STATION	Gage height, U.S.E.D. elevation, for rated flows of:								
	2000 cfs	3000 cfs	4000 cfs	5000 cfs	6000 cfs	7000 cfs	8000 cfs	9000 cfs	10000 cfs
Sacramento River at Sacramento	Flows under 30000 cfs are affected by tidal action and are rated by slope-velocity methods not applicable to this table.								
at Verona		8.6	9.9	10.8	11.5	12.2	12.8	13.3	13.8

NOTE: Station is maintained jointly by the Division of Water Resources and the Water Resources Branch of the U. S. Geological Survey. Stream flow measurements are made also by the U. S. Bureau of Reclamation. It is located at the Knights Landing Railroad Bridge, Mile 34.0 above Sacramento, below the point of discharge to the river of Colusa Basin drainage via the Back Borrow Pit of Reclamation Districts 108 and 787.

NOTE: This represents the flow of the Sacramento River past Sacramento (below the City of Sacramento intake) to the Delta. Additional water flows to the Delta via East Borrow Pit of Yolo By-Pass. (See Tables 49 and 55.) Daily mean flows are computed from newly derived curves which take into account tidal fluctuations during low stages.

NOTE: U. S. Geological Survey station located on Stony Creek about 5 miles above mouth. Prior to February 1946 station was located 8 miles above mouth. Flow to the Sacramento River is cut off during the irrigation season by an earth fill installed by Glenn-Colusa Irrigation District to transport water from their main canal across Stony Creek. Stony Creek is a west-side tributary at Mile 136.3R. 2083 acre feet was diverted in April by G.C.I.D.

NOTE: This station is operated by Division of Water Resources with cooperation by U. S. Bureau of Reclamation. This is the discharge to the Sacramento River at Mile 84.0 Left and is measured at and regulated by the gravity culverts at the mouth of the slough. This flow, together with that shown in Tables 40 and 41 is, during the summer months, made up almost entirely of return water from lands irrigated by Feather River diversions. Discharge from the Sacramento River to Butte Basin over Moulton and Colusa weirs is shown in Tables 22 and 24.

* Also known as Colusa Trough at Highway 20 and Colusa Trough at Tahoe Ukiah Highway.

NOTE: This station is operated by State Division of Water Resources with cooperation by U. S. Bureau of Reclamation. This is return water flowing in the main drain of Reclamation District 2047; it is drainage chiefly from lands irrigated by Glenn-Colusa, Provident, Princeton-Codora-Glenn, Compton-Delevan, Maxwell and Jacinto Irrigation Districts. Flow reaches Sacramento River via Back Borrow Pit.

NOTE: Knights Landing Ridge Cut diverts water from the Back Borrow Pit of Reclamation District 108 at a point above the Outfall Gates, into the Yolo By-Pass above Elkhorn. Winter flows are uncontrolled. Summer flows for irrigation are controlled at the Outfall Gates and at the junction with Yolo By-Pass by weir boards and gates. Daily mean flows for the period April to October are estimated based on current-meter measurements. Station has been operated cooperatively since 1941 by the Division of Water Resources and the U. S. Geological Survey.

NOTE: This station is operated by Division of Water Resources. This is the drainage from Colusa Basin passing down the Back Borrow Pit of Reclamation Districts 108 and 787 and entering the Sacramento River at Mile 34.15R, just above the Knights Landing gaging station. It does not include any drainage from Reclamation District 787 entering the Back Borrow Pit via Sycamore Slough outlet (See Table 33 for Sycamore Slough contribution). Irregularities in the flow are due to checking operations at the Knights Landing Outfall Gates whereby a portion of the flow of the Back Borrow Pit is diverted to the Knights Landing Ridge Cut. This diversion is shown in Table 31. Total flow to Sacramento River is sum of Tables 32 and 33.

NOTE: This is discharge from Butte Slough to Sutter By-Pass. During low flow periods gates at head of Slough are regulated (Table 25) which forces water under Long Bridge as shown in this table. Normal summer flows are primarily from Feather River sources. During flood periods Sacramento River water enters Butte Basin above Butte City by bank spill and over Moulton and Colusa weirs. The purpose of the summer regulation is to make water available for use on Sutter By-Pass lands (below Long Bridge) and Butte Slough Irrigation Company in R.D. 70. This station is maintained and operated by the Division of Water Resources.

NOTE: This is the discharge (measured at Weir #4) to the East Borrow Pit of the Sutter By-Pass at Mile 16.0 (north from Chandler). This flow is made up entirely of Feather River drainage or return flows. This flow and flow from Butte Slough (Table 35) makes up the entire Feather River contribution to the Sutter By-Pass. See footnote Table 35.

NOTE: This is the drainage from Reclamation District 1500 discharged to West Borrow Pit of Sutter By-Pass and thence via Sacramento Slough (in the By-Pass) to Sacramento River. (Table 38.) A small amount of gravity drainage through the pumps during the summer months is included in the above flow.

NOTE: This is the discharge to the Sacramento River at Mile 21.2L via Sacramento Slough. This is the entire outflow of the Sutter By-Pass area and R.D. 1500. During high water periods the slough is entirely submerged as it lies within the By-Pass area. Sharp rises in river elevation will cause zero or negative flow. See tables 26, 35, 36 and 37, which, when combined, will give the measured flow entering the By-Pass area. This station is operated by the Division of Water Resources.

NOTE: This station is maintained by the Division of Water Resources. It is located on the right bank at Mile 23.0 above mouth. Station is rated above 20,000 c.f.s. by means of simultaneous measurements of Yuba River and Feather River at Marysville with appropriate time lag between Marysville and Shanghai Bend.

* Cross Canal, the main drain between Reclamation Districts 1000 and 1001, joins the Sacramento River at Mile 19.6L.

NOTE: This is drainage returned to the Sacramento River via the cross-canal by pumping and gravity.

NOTE: Station is maintained jointly by Division of Water Resources and the Water Resources Branch of the U. S. Geological Survey. Station is located at the "H" Street Bridge and is 6.0 miles above mouth of river. The flows shown may be assumed to be the discharge to the Sacramento River, as American River diversions below this station were negligible in 1947.

* Also known as Yolo By-Pass at Elkhorn.

NOTE: The flow of this station is referred to the recorder at the end of the Sacramento By-Pass except during periods of high water when it is referred to the recorder at the Woodland-Elkhorn highway crossing. To get total flow through Yolo By-Pass below Sacramento, combine this flow with the flow in Table 49 and the flows of Putah Creek. The flow in this table includes the flows of Cache Creek (Table 54), Knights Landing Ridge Cut (Table 31), and Fremont Weir. Station has been operated cooperatively since 1941 by the Division of Water Resources and the Water Resources Branch of the U.S. Geological Survey.

NOTE: This is a permanent station maintained throughout the year under Federal-State cooperation by the Water Resources Branch of the U. S. Geological Survey. It is located at Mile 268.1L. Daily mean release from Friant Reservoir into San Joaquin River obtainable from this table by subtracting flows of Cottonwood Creek (Table 65).

* Also known as James By-Pass and Fresno Slough Cut-off.

NOTE: Station maintained, operated and flow computed by Kings River Water Association. Station is located on Kerman-San Joaquin highway crossing on Fresno Slough By-Pass 6.0 miles above its confluence with Fresno Slough. Fresno Slough By-Pass enters Fresno Slough at Mile 11.8R above mouth of Fresno Slough.

* Also called Turner Island Bridge and San Joaquin River near Los Banos.

NOTE: Station maintained, operated and flow computed by U. S. Bureau of Reclamation. Station is located at county road bridge eight miles east and six miles north of Los Banos, Mile 158.7 above mouth of San Joaquin River. An undetermined amount of water by-passes this station through Pick Anderson Slough and other channels.

NOTE: Station is on county bridge on road between Gustine and Stevinson, Mile 129.5 above mouth of San Joaquin River and 5.7 miles above the mouth of the Merced River. Recorder operated by Water Resources Branch of the U. S. Geological Survey. Measurements of flow by U. S. Geological Survey, Bureau of Reclamation and Division of Water Resources. Additional water during high flow periods passes this station via Mud Slough, see Table 73.

NOTE: This is a permanent station maintained throughout the year under Federal-State cooperation by the Water Resources Branch of the U. S. Geological Survey. It is located at Hills Ferry Bridge, Mile 123.7 above mouth of San Joaquin River and just below the mouth of the Merced River. Combine flow of Merced River Slough, Table 81, to give total flow passing this point.

NOTE: This station records the flow which at high stages in the Merced River by-passes the Hills Ferry Road Bridge and reaches the San Joaquin River below the U.S.G.S. station "near Newman", at Mile 122.2 above mouth. Table 80 records the entire flow of the Merced River and the flow in Table 81 is included in Table 80. This is a U. S. Geological Survey and U. S. Bureau of Reclamation cooperative station. Station also known as "Merced River Slough near Hills Ferry Road Bridge."

(1) Additional diversion: January 2041, February 1864, November 2077 and December 2148.
(2) Formerly listed as R. A. Westbrook.
(3) Combined acreage this plant and one at Mile 8.3R. An additional 18 acres irrigated by wells.
(4) 10" unit removed in 1947.
(5) See plant at Mile 7.9R.
(6) Installed in 1946, first listing in 1947.
(7) Formerly listed as Nesbit, Driver and Fong Yen Co.
(8) Formerly listed as Joseph Mellor.
(9) Flooded only. Received additional water from wells.
(10) Includes 1260 acres outside district.

(1) Also receives water from controlled drainage.
(2) Newly installed unit in 1947.
(3) Formerly listed as J. H. Yates.
(4) Includes 20 acres on Coffman lands.
(5) Formerly listed as Joseph Miller.
(6) Replaces 12" unit formerly listed at this location.
(7) No operation of 14" unit in 1947.
(8) Additional water received from plant at Mile 33.0R on Back Borrow Pit.
(9) 80 acres of this land flooded only.
(10) Formerly listed at B. P. Lillienthal, Trustee.
(11) Cooperative diversion between plants at Mile 81.8L and 81.5L
(12) Replaces 8" unit formerly listed at this location.
(13) New installation in 1946. First listing in 1947.
(14) An additional 104 acre-feet diverted in February.
(15) Replaces 10" pump previously at this location.
(16) Formerly listed as Mrs. W. D. DeJarnatt and Mayfair Packing Company.
(17) Estimated from 1946 data.

(1) Replaces 6" unit listed at this location in 1946.
(2) Operated only one unit in 1947.
(3) Acreage estimated to be same as that listed in 1946.
(4) Replaces 8" pump formerly listed at this location.
(5) No operation of 15" unit during 1947.
(6) The 8" and 12" units listed at this location in 1946 were removed.
(7) The 16" unit listed at this location in 1946 was removed.
(8) There was some exchange of water between plant at Mile 95.8L and one at Mile 98.6L.
(9) Formerly listed as Mile 98.3L.
(10) Also receives water from pump at Mile 99.8L.
(11) Includes 75 acres on Mitchell lands and 20 acres on Middlecamp lands.
(12) Also furnishes water to plant at Mile 99.1L.
(13) Also served by wells.
(14) Furnished some water to plant on Colusa Trough, Mile 11.7L.
(15) No operation of 16" unit in 1947.
(16) Previously installed, newly located.
(17) Acreage estimated by Mr. Boyd.
(18) New installation 1947.
(19) Also served by gravity from Butte Creek.
(20) See plant at Mile 154.8R.

(1) Formerly listed as Butte City Ranch.
(2) Replaces 3" gas pump formerly listed at this location.
(3) See plant at Mile 154.8R.
(4) Previously operated, first listing 1947.
(5) The 4" unit moved to Mile 154.7R.
(6) Formerly listed at Mile 154.6R.
(7) This is a common point of diversion for Glenn-Colusa, Compton-Delevan, Provident, Princeton-Codora-Glenn and Maxwell Irrigation Districts.
(8) An additional 2083 acre-feet from Stony Creek in April. Includes 2926 acre-feet from gravity from Sacramento River.
(9) Includes 180 acres outside district.
(10) Includes 1598 acres outside district.
(11) Diversion through Glenn-Colusa Irrigation District plant at Mile 154.8R.
(12) Includes 774 acre-feet from controlled drains during the month of April.
(13) Combined acreage for this plant and one at Mile 124.2R, Sacramento River, and plants on Colusa Trough, Miles 20.5R, 24.2R and 27.2R.
(14) An indeterminate amount of this acreage of rice lands re-used for duck clubs.
(15) Combined acreage for this plant and ones at Miles 112.4R and 123.9R
(16) All derived from controlled drainage.
(17) All gun club lands.
(18) This acreage was total amount estimated that was flooded during July before plant shut down for season.

(1) Formerly listed as J. Keithdriber.
(2) Listed in 1946 report as J. F. Nunez.
(3) This unit has been abandoned.
(4) An additional 9 acre-feet diverted in November for stock water.
(5) Combined acreage for this plant and one at Mile 246.0R.
(6) See plant at Mile 240.5L.
(7) Formerly listed as 2-6" units. Was changed from 2-6" units to 3-8" units in 1945.
(8) Additional water diverted as follows (in acre-feet): January 190, February 133, November 177, and December 159.

* Main Drain of Reclamation District #2047.
** Mileage along Colusa Trough above Colusa-Williams Highway.
(1) Formerly listed on Colusa Trough, diversions actually from controlled interior drainage channels.
(2) This is the combined plant replacing plants formerly listed at Mile 2.2L and Mile 2.3L.
(3) This is the combined plant formerly listed as separate plants at this mile in 1946.
(4) All gun club lands.
(5) Formerly listed as Ellis, Knowels and Lynn.
(6) New installation in 1947.
(7) Also receives water from plant on Sacramento River, Mile 103.7R.
(8) See plant at Mile 154.8R, Sacramento River.
(9) Mileage correction.
(10) Formerly listed as 1-10" and 1-12".

(1) Partially estimated.
(2) Combined acreage for this plant and one at Mile 13.2R.
(3) Additional diversion--November 1000 acre-feet; December 800 acre-feet.
(4) Add duck club lands.
(5) See plant at Mile 9.3R.
(6) Replaces 2-10" units formerly listed at this location.
(7) Of this figure 166 acres used for duck clubs.
(8) Received some water from plant at Mile 20.9R.
(9) Furnished some water to plant at Mile 20.4R.
(10) Formerly listed as Opposite Mile 21.4R.
(11) Flow in Butte Slough, derived from Butte Creek, is controlled by Outfall Gates at its junction with Sacramento River and is thereby retained in Butte Slough to discharge into East and West Borrow Pits of Sutter By-Pass near "Long Bridge." The Outfall Gates are maintained by the Division of Water Resources and are cooperatively operated with the Butte Slough Irr. Co. See Sutter By-Pass Diversions, Table 99.
(12) See acreages under rediversion-West Borrow Pit Sutter By-Pass. A considerable additional but indeterminage acreage was served by sub-irrigation and direct diversions from flow diverted to East Borrow Pit of Sutter By-Pass which is joined by Feather River return flow entering via Wadsworth Canal, Table 36. See East Borrow Pit Sutter By-Pass Diversions, Table 99.
(13) Also served by wells.

(1) Received additional water from Sutter Butte Canal.
(2) This is a common point of diversion for the Sutter-Butte Canal Co., Richvale Irrigation District and Biggs-West Gridley water districts. Diversions are reported separately. The Sutter Butte Canal Company operates a pumping plant at Mile 38.1R.
(3) There is included in these totals 51,395 acre-feet purchased from P. G. & E. Co., however, no segregation was made between districts or companies in this table.
(4) Includes Mile 38.1R.
(5) Approximately 15 per cent of this figure received from controlled drainage.
(6) Additional water from controlled drainage.
(7) Diversions for gun clubs--492 acre-feet in October and an additional 2113 acre-feet in December.

* Distance from mouth of San Joaquin River 4½ miles below Antioch (mileage as established by War Department Survey of 1913-15).

(1) This is the point of diversion of the U. S. Bureau of Reclamation Contra Costa Canal at head of Rock Slough.

(2) Additional acre-feet diverted as follows: January 1571, February 1258, November 1600, December 1641.

(3) Water was used for industrial, municipal and small agricultural diversions--no segregation was made.

(4) At junction of Old River and Italian Slough. Pumping plant is located 2 3/4 miles southwest along Italian Slough and extension cut.

(5) Combined acreage this plant and G. Lindeman plant at Mile 47.2L.

(6) Formerly listed as Gus Lindeman.

(7) Includes 813 acre-feet delivered to Tracy-Clover Irrigation District to supplement the well pump supply for that district.

* Distance along Tom Paine Slough from its mouth which is at Mile 54.3 on Old San Joaquin River. (War Department Survey of 1913-15.)

(1) This is combined acreage this plant and one at Mile 1.5S.
(2) See plant at Mile 0.7S.
(3) This plant installed in 1946, however was first listed in 1947.
(4) To junction of Tom Paine Slough and dredger cut. Pumping plant is located 1½ miles south along dredger cut.
(5) Replaces 10" and 12" units previously listed at this location.
(6) Acreage estimated--served through West Side irrigation--Old San Joaquin River, Mile 47.65L.
(7) Combined acreage for this plant and those plants at Miles 6.3S, 8.3S and 9.0S.
(8) See plant at Mile 2.9S.

*Mileage along San Joaquin River from its mouth 4⅛ miles below Antioch. (Mileage established by War Department Survey of 1913-15.)

(1) Received an additional 50 acre-feet from plant at Mile 82.0L in May.
(2) Furnished 50 acre-feet to plant at Mile 81.95L. Additional water diverted: January - 194 acre-feet, February 474 acre-feet.
(3) Diverted 312 acre-feet in February, 233 acre-feet in November and 131 acre-feet in December.
(4) Approximately 1540 acres of this land was double-cropped. However, the double cropped acreage listed once.
(5) Pump is on cut leading to West Stanislaus Irrigation District plant.
(6) Formerly listed as 2-14" pumps.
(7) Formerly listed as Dos Rios Ranch.
(8) Additional water diverted in November - 1 acre-foot.
(9) Additional water received from Patterson Ranch Company.
(10) Approximately 216 acres of this figure double-cropped. However, the double-cropped acreage listed once.
(11) Formerly listed as Silva and Freitas Ranch.
(12) Formerly listed as L. W. Long.
(13) Furnished some water to plant at Mile 104.4L.
(14) Replaced by plant at Mile 114.63R.
(15) Additional water diverted in February - 3 acre-feet.
(16) Reinstallation at old point of diversion.

* Mileage listed are miles above mouth of San Joaquin River.

(1) Size of unit not listed.
(2) Replaced 8" pump March 1947.
(3) Replaced 10" pump December 1947.
(4) Pumped drainage water in August, September and November.
(5) Head of East Side Canal. Point of diversion is siphon in E. S. Canal 0.3L below Head.
(6) Pump located below East Side Canal 1.4R below Head. Major source of water was Sand Slough joining East Side Canal at 1.0R below Head.
(7) Replaced 14" pump March 1947.
(8) This is at Head of Temple Slough.
(9) Includes some double cropping and interplanting.
(10) Formerly located at mile 206.0L.
(11) Acreage combined under plants at mile 205.11L, 205.33L and 205.59L.
(12) Installed March 1947.
(13) Installed March 1947.
(14) Mouth of Cottonwood Creek is 0.1 miles below Friant Dam.
(15) Includes Main Canal, Helm Canal, Outside Canal and Helm Ditch. Excludes diversions through Outside Canal to Dr. E. L. Mott and Panoche Water Distribution Association. Also excludes Sam Hamburg's diversions from June 15 through September 15.
(16) Point of delivery is considered to be Mendota Pool.
(17) Scattered flooding of grazing land and duck ponds.
(18) Rediverted from Outside Canal by means of 2-12" pumps on intake channel at mile 18.24L below Head and 2-12" pumps on intake channel at mile 19.24L below Head. Plants installed in 1947.

(19) Rediverted from Outside Canal by means of 3-30" and 1-24" pumps on intake channel at mile 23.58L below Head. Plant installed in 1947.
(20) Rediverted from Outside Canal by means of 3-24" pumps on intake channel located at mile 25.75L below Head. One new pump installed in 1947. Except for June 15--September 15 period, water was received from San Joaquin Canal Co.
(21) Head of Mowry Canal.
(22) Duck ponds.
(23) Formerly listed as Fresno Ranch.
(24) Scattered flooding of grazing land.
(25) Point of rediversion is on Lone Willow Slough at mile 2.2R below Head.
(26) Delivery is through Chowchilla Canal rediverting from Lone Willow Slough 2.3R miles below Head.
(27) Scattered flooding of grazing land. This is total acreage owned, but number of acres flooded is not known.
(28) Head of Aliso Canal.
(29) Formerly listed as El Peco Ranch.
(30) No acreage listed. Practically all water diverted was lost by seepage in transit.
(31) Additional water received from Fresno Irrigation District.

(1) Formerly listed as West Coast Life Insurance Company.
(2) Listed in 1946 as 6" pump.
(3) Double cropped - Tomatoes and Sudan grass.
(4) Size of unit not listed.
(5) Formerly listed as Fresno State College.
(6) Point of Diversion and place of use is on island in midstream.
(7) Installed in 1947. Replaces 5" pump formerly at same location.
(8) Includes 8 acres of cotton irrigated by J. E. Cobb pump at mile 259.39R.
(9) Formerly listed as Geo. E. Howe.
(10) Acreage combined under plants at Miles 258.50L, 258.66L and 258.80L.

(11) Installed in 1947. Replaces 5" pump formerly at same location.
(12) Installed in 1947. Replaces 6" pump formerly at same location.
(13) Does not include 8 acres of cotton belonging to L. D. Cobb irrigated by this pump.
(14) Formerly listed as J. C. Cobb.
(15) Installed October 1946. Replaces 5" pump formerly at same location.
(16) Point of diversion and place of use is on island in midstream.
(17) Additional water received from wells.
(18) Additional water received from E. G. Rank pump at mile 262.48L.
(19) Does not include additional acreage of F. W. Fewel served by this pump.

* Water in Fresno Slough is derived from surplus flows of King's River via Fresno Slough By-Pass and from San Joaquin River by Mendota Pool backwater created by Mendota Dam.
** Mileage listed is Fresno Slough mileage above its mouth on San Joaquin River. Mouth of Fresno Slough at Mile 208.93L above mouth of San Joaquin River and Mile 60.7L below Friant.

(1) Point of diversion was at 10.9L in 1946.
(2) Four pumps in operation - size not listed.
(3) Replaced 12" pump April 1947.
(4) Acreage combined under plants at Mile 9.6R and 11.8R.
(5) Size of pump not listed. Diverted from Fresno Slough By-Pass 0.75R miles above confluence.

(1) Replaces old 6" unit listed at this location in 1946.
(2) Formerly listed as A. J. Chisholm.
(3) Diverted an additional 9 acre-feet in December.
(4) Moved from 3.1R.
(5) Replaces 5" unit listed at 3.1R in 1946.
(6) Formerly listed as Winfield S. Overton Estate.
(7) Received 207 acre-feet from plant at Mile 5.95R.
(8) Formerly listed as McMullin Reclamation District 2075.
(9) Furnished 207 acre-feet to plant at Mile 5.9R. Additional diversion: November 93 acre-feet, December 86 acre-feet.
(10) Diverted 5 acre-feet in February.
(11) Diverted an additional 15 acre-feet in November.
(12) This acreage listed as 200 acres in 1946.
(13) Formerly listed as Riverside Ranch.
(14) Oakdale Irrigation District for season of 1947 maintained plants at Miles 35.9L and 37.0L to supplement District gravity supply.
(15) Additional water diverted in February - 37 acre-feet.

TABLE 112

AVERAGE MONTHLY DIVERSIONS IN PER CENT OF SEASONAL FOR SACRAMENTO AND SAN JOAQUIN VALLEY STREAMS

	Period of Record	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.

(1) Excluding such diversions for municipal use as City of Sacramento and the City of Redding.

TABLE 125

RICE ACREAGE IN CALIFORNIA

A Comparison of Total Rice Acreage in California with Rice Acreage Irrigated from the Sacramento and San Joaquin River Systems Covered by Sacramento-San Joaquin Water Supervision

Rice Acreage							
Year	Total in State (1)	Irrigated from Sacramento & San Joaquin River Systems	Ratio in Per cent (2)	Year	Total in State (1)	Irrigated from Sacramento & San Joaquin River Systems	Ratio in Per cent (2)
1924	90000	89000	99	1936	138000	104000	75
1925	103000	95000	92	1937	132000	109000	82
1926	149000	129000	87	1938	125000	95000	76
1927	160000	123000	77	1939	120000	104000	87
1928	132000	101000	76	1940	118000	94000	80
1929	95000	74000	78	1941	153000	120000	78
1930	110000	88000	80	1942	207000	159000	77
1931	125000	126000	100	1943	237000	186000	77
1932	110000	91000	83	1944	246000	200000	81
1933	108000	87000	80	1945	249000	187000	75
1934	108000	92000	85	1946	253000	200000	79
1935	100000	78000	78	1947	237000	215000(3)	91
				Average 1924-1947	150000	123000	82

(1) As reported by Federal-State Crop Reporting Service.
(2) Ratio of acreage on Sacramento and San Joaquin River Systems to total State acreage.
(3) Rice acreage on Upper San Joaquin River included in 1947 but excluded under this heading for previous years.

* For maximum salinities recorded 1924-1936 see previous reports.
** Normal taken as 50-year mean (1889-1939) of natural runoff at foothill stations of major tributaries.
*** Estimated
(1) For location and description see Table 127.
(2) Sampling by State discontinued in 1941 and resumed in 1944 in cooperation with the U. S. Bureau of Reclamation.

TABLE 127

DESCRIPTION OF ACTIVE SALINITY OBSERVATION STATIONS - 1947

(Refer to previous Water Supervision Reports for description of stations which have been discontinued.)

STATION	Miles from Golden Gate (1)	Time Interval (2) Hours	Time Interval (2) Mins.	LOCATION
				SAN FRANCISCO, SAN PABLO AND SUISUN BAYS
Point Orient	12.3	2	20	North end of San Francisco Bay, East Shore, one-half mile south of Point San Pablo Wharf of Standard Oil Company.
Point San Pedro	15.0	2	30	South end of San Pablo Bay, West Shore of San Pedro Strait, one-quarter mile north of Point San Pedro.
Point Pinole	19.0	2	50	South Shore of San Pablo Bay, at Point Pinole on wharf of Atlas Powder Company.
Hercules	22.7	3	10	South Shore of San Pablo Bay, at Refugio Point on wharf of Hercules Powder Company.
Point Davis	25.2	3	15	East end San Pablo Bay, South Shore, Oleum Wharf of Union Oil Company
Grand View	25.2	3	15	Northwest shore of San Pablo Bay at mouth of Petaluma Creek.
Crockett	27.7	3	30	West end of Carquinez Strait, South Shore, 0.2 mile east of Carquinez Bridge on wharf of C. and H. Sugar Refining Corporation.
Benicia	32.5	3	50	East end of Carquinez Strait, North Shore, 1.1 mile west of Southern Pacific Co. railroad bridge at Benicia Arsenal.
Martinez	32.7	3	50	East end of Carquinez Strait, South Shore, 1.0 mile west of Southern Pacific Co. railroad bridge, at Municipal Ferry Slip.
West Suisun	37.0	4	10	West end of Suisun Bay, North Shore, 2.5 miles northeast of Southern Pacific railroad bridge at service pier of U. S. Maritime Commission, Reserve Fleet Mooring area.
Port Chicago	41.0	4	20	South Shore of Suisun Bay at U. S. Naval ammunition loading wharf below Point Chicago.
Nichols	42.7	4	25	South Shore of Suisun Bay, on Middle Point at wharf of General Chemical Company.
O & A Ferry	46.5	4	40	Upper end Suisun Bay between Mallard Station and Chipps Island at Sacramento Northern Railroad Ferry Crossing.
Innisfail Ferry	47.3	4	50	Montezuma Slough, about one mile east of junction with Cutoff Slough, near North end of Grizzly Island.
Pittsburg	48.0	5	00	East end of Suisun Bay, South Shore, at Pittsburg Yacht Harbor.
				SACRAMENTO RIVER DELTA
Collinsville	50.8	5	25	Sacramento River, North Bank at junction with San Joaquin River.
Three Mile Slough Bridge	60.0	5	55	At junction of Slough and Sacramento River.
Rio Vista Bridge	63.5	6	05	At Highway Bridge near northerly limits of Rio Vista.
Isleton Bridge	68.7	6	30	Sacramento River, one mile upstream from Isleton.
				SAN JOAQUIN RIVER DELTA
Winter Island	53.1	5	50	Upper end of Winter Island, north shore New York Slough at junction of Broad and New York Sloughs.
Antioch	54.9	5	55	San Joaquin River, at City Water Works pumping plant.
Millers Harbor	58.2	6	10	South Shore San Joaquin River at Antioch Bridge.
Webb Pump	72.0	7	00	False River, two miles below Old River Junction.
Opposite Central Landing	72.0	7	00	Mokelumne River, on Andrus Island directly opposite Central Landing on Bouldin Island.
Dutch Slough	73.0	7	05	At Bethel Island Bridge.
East Contra Costa Irr. Dist.	86.7	8	20	Indian Slough, at East Contra Costa Irrigation Dist. pumping plant.
Victoria Island	89.6	8	35	Old River at Borden Highway Crossing.
Clifton Court Ferry	94.2	9	10	Old River just below junction with Grant Line Canal.
South Fabian	100.0	9	40	Old River, two miles East of Bethany.
Grant Line Bridge	101.0	9	50	Grant Line Canal, 5.5 miles above junction with Old River, at Tracy Road Crossing.
Mossdale Bridge	108.5	10	50	San Joaquin River at U. S. 50 Highway Crossing about 3 miles southwest of Lathrop.
Banta-Carbona Irrig. Dist.	119.0	11	00	San Joaquin River at Banta-Carbona Irrig. Dist. Intake Canal.
Vernalis U.S.G.S. Station	127.0	11	00	San Joaquin River at Durham Ferry Bridge, above tidal influence.

(1) Mileage measured to station along main channel. For stations off the main channel, the mileage shown is the same distance along the main channel to a point whereon the time of the occurrence of the tidal phase is the same as that of the observation station.

(2) Time interval between high tide at Golden Gate and time for taking samples at station.

TABLE 128

SALINITY OBSERVATIONS, SACRAMENTO-SAN JOAQUIN DELTA AND UPPER BAYS

Samples taken by local observers approximately one and one-half hours after high high tide.
Salinity expressed in parts of chlorine per 100,000 parts of water.

* Normal = 50 year mean (1889-1939).

(1) Does not include inflows from Mokelumne and Calaveras Rivers, Yolo By-Pass and other minor tributaries.

(2) Delta area taken at 435,000 acres which includes all lands, levees, water surfaces, etc., within Delta boundary.

(3) Sacramento and Mokelumne deltas combined as the Sacramento River contributes a large flow to Mokelumne River Delta through Georgiana and Three Mile Sloughs.

(4) No continuous record. Lowest discharge measured.
