ACKNOWLEDGMENT

Valuable assistance has been rendered by many individuals and by many public and private agencies in the conduct of the field work and the preparation of data for this report of the Sacramento-San Joaquin Water Supervision activities.

Landowners, water users and the executives, engineers, managers and superintendents of various water organizations throughout the territory covered by this work have cooperated fully in furnishing the many varied data requested.

The Pacific Gas and Electric Company and the Merced, Modesto, and Turlock irrigation districts have furnished a large number of electric power consumption records for use in the compilation of pumped diversions.

The United States Geological Survey, Department of Interior, has extended valuable cooperation in gathering and assembling stream-flow data.

The United States Bureau of Reclamation, Department of Interior, has furnished data relating to inflows and operation releases of the Shasta Reservoir and Millerton Lake (Friant Reservoir).

The City of San Francisco Public Utilities Commission, Hetch Hetchy Water Supply, Kings River Water Association, San Joaquin Canal Company, Corcoran Irrigation District and the United States Bureau of Reclamation have made available stream-flow data for certain San Joaquin Valley streams.

The Modesto, Oakdale, and Turlock irrigation districts have assisted in observing and maintaining recording gages in the San Joaquin Valley area.

The United States Bureau of Reclamation provided the funds necessary to maintain the regular program of salinity observations in the Sacramento-San Joaquin Delta during 1950.

ORGANIZATION

Frank B. Durkee — Director of Public Works

A. D. Edmonston — State Engineer

The activity covered by this report
is under the direction
of

T. B. Waddell — Principal Hydraulic Engineer

The preparation of this report and
the collection and compilation of the supporting
data were under the supervision
of

Irvin M. Ingerson — Supervising Hydraulic Engineer

Field and Office Personnel

Carl A. Werner — Senior Hydraulic Engineer
In charge of stream-flow measurements and computations

Arthur M. Baker — Associate Hydrographer
In charge of diversion measurements and computations

Assistants

Claire H. Epperson	Assistant Hydrographer

FOREWORD

A contract was entered into between the United States and the Department of Public Works which provides for the performance by the Division of Water Resources of certain hydrographic work which has been formerly performed by the U. S. Bureau of Reclamation and the continuation of the Sacramento-San Joaquin Water Supervision activities of the Division of Water Resources. This contract, designated as U. S. Bureau of Reclamation Contract No. 175r-1596 and Division of Water Resources Contract No. 3-170, was executed on December 30, 1948 and became effective October 1, 1948.

The work performed during 1950 by the Division of Water Resources under this contract includes the collection of data on stream flows and diversions for the Sacramento and San Joaquin rivers and their tributaries formerly obtained by both agencies and in addition data formerly obtained by the Bureau of Reclamation on flows and diversions for the Tule River, measurements of inflows to Tulare Lake and quality and temperatures of water. In accordance with the terms of this contract, the Division transmitted to the Bureau of Reclamation periodic hydrographic reports for the latter's use in the operation of the Central Valley Project.

REPORT OF
SACRAMENTO-SAN JOAQUIN WATER SUPERVISION
FOR 1950

SACRAMENTO-SAN JOAQUIN WATER SUPERVISION

Water supervision activities, resulting from the efforts of the first Sacramento-San Joaquin River Problems Conference and its Permanent Committee working with the former Division of Water Rights, were inaugurated in 1924. A complete description of the origin, history and conduct of the work is found in the 1924 and 1926 Biennial Reports of the former Division of Water Rights, in Bulletin Number 4 of that Division, and in Bulletin Number 23 of the succeeding Division of Water Resources. The latter bulletin brings together all data and measurements obtained in the first five-year period, 1924 to 1928, inclusive. Annual Water Supervision reports for subsequent years are in separately bound books similar to this report.

Objectives

At the outset, the objective of the work of Water Supervision in the valley floor areas along the Sacramento and San Joaquin river system was to afford relief to water users from the difficulties of obtaining irrigation supplies occasioned by uncoordinated diversions during years of substantially subnormal runoff. The situation called for voluntary regulation of diversions in order to alleviate as far as possible the damage from the serious shortages in the water supplies needed for irrigation, municipal consumption, salinity control in the Sacramento-San Joaquin Delta, and navigation purposes. Equitable coordination of diversions was accomplished primarily through the Water Supervision program.

There is no agreement between the water users under which a watermaster might distribute the natural water supply equitably to those entitled to receive it, but it appears inevitable that such an agreement, embracing a definite schedule of relative water rights, will be developed. Its realization will require, however, reliable data, covering a long period of years, on the actual diversions and uses of water, stream flows, stream accretions and salinity encroachment into the Sacramento-San Joaquin Delta. Looking toward that end, it has been the objective of the Division of Water Resources through its Water Supervision work, to collect and record all of the basic hydrographic data necessary to formulate an intelligent and practicable agreement defining the respective water rights of the parties affected in the area covered.

Scope of Work

The area embraced by the Sacramento-San Joaquin Water Supervision work lies on the Sacramento and San Joaquin Valley floors. It specifically covers all of the lands irrigated from the Sacramento River between Redding and Sacramento, including those irrigated from the Colusa Trough, Back Borrow Pit, Knights Landing Ridge Cut, and Yolo By-Pass

above West Sacramento, from Lower Butte Creek and Butte Slough, from the Feather River below Oroville, from the Yuba River below Smartville, from the Bear River below Wheatland from the Sutter By-Pass and Sacramento Slough, from the American River below Fair Oaks, from the Cosumnes River below Michigan Bar, from the Mokelumne River below Woodbridge, from the Calaveras River below Jenny Lind, from the San Joaquin River between Friant Dam and Mossdale Bridge, from the Merced River below Snelling, from the Tuolumne River below La Grange, from Dry Creek (tributary to Tuolumne River) below Oakdale-Waterford road, from the Stanislaus River below Knights Ferry, and from the Tule River below South Fork, and the irrigated areas lying on the "uplands" side of and receiving water from the San Joaquin River between Mossdale Bridge and Stockton, Old San Joaquin River and Tom Paine Slough. The area covered and its geographical relation to the Central Valley Drainage Basin are shown on Plate 1.

Water Supervision Activities

The work of the Sacramento-San Joaquin Water Supervision unit of the Division of Water Resources is divided into two portions, field work, mainly during the spring, summer and fall months, and office work during the winter and early spring months.

The field activities include:

(1) Measurement of stream flow passing the many recording stations along the river and drainage channels;

(2) Measurements of the amounts of water diverted and collection of records of use by each water user;

(3) Measurements of the amounts of water returned to natural channels, through drainage plants or gravity drains, for possible re-use;

(4) Obtaining an annual census of irrigated acreages and crops supplied by either a primary, or drainage water supply, or both;

(5) Maintaining the Delta salinity observation program;

(6) Cooperation with and assistance to water users in connection with individual problems of diversion; and

(7) Assistance with hydrographic activities of cooperating public and private agencies, and of other units of the Division.

The office work comprises mainly the assembly, computation and analysis of hydrographic and other data collected during the field season for presentation in the annual report of Water Supervision. This report contains the basic records of water supply available to, and the water utilization by, each user of water from the streams covered in the area. The computation of stream flow, drainage and accretions involves the conversion of the recorded daily gage records to figures showing the daily flows in second-feet and monthly runoffs in acre-feet. The computation of the amounts of water diverted by each water user involves the reduction of data showing the operation of his diversion plant, its electric power consumption, and its efficiency. The results of these computations are

then compiled in the tabulations in this report for the purpose of giving basic records that are readily usable by all interested parties. The office work also includes the preparation of certain hydrographic data in form to be used as a guide in the ensuing season's field work.

In accordance with the provisions of Contract No. 3-170 between the Division of Water Resources and the U. S. Bureau of Reclamation, the Division has computed, on a preliminary basis, the daily mean flows at 36 stream-flow stations, and the diversions, by reaches, from the main streams and tributaries in the Sacramento and San Joaquin valleys and has transmitted the results of these computations monthly to the Regional headquarters of the Bureau of Reclamation.

The office work in connection with the program of observing Delta salinity conditions consists of collating the results of the chlorine tests from samples taken at four-day intervals at each observation station. These salinity records are presented each month in a bulletin which is distributed to governmental agencies and to many individuals and organizations that are interested in the results.

Hydrographic Activities of Cooperating Agencies

The United States Geological Survey, Water Resources Branch, through continued cooperative agreements with the Division of Water Resources, has maintained a series of stream gaging stations in the Sacramento and San Joaquin valleys. A large amount of the stream-flow data contained in this report has been collected and computed by the Geological Survey, and much of this material has been specially completed for inclusion in this report prior to its official publication in Federal reports.

The Modesto Irrigation District, the Oakdale Irrigation District, the South San Joaquin Irrigation District, and the Turlock Irrigation District in the San Joaquin Valley have cooperated with the Water Supervision engineers by assisting in the installation of certain recorder equipped stream gaging stations and are continuing to cooperate by operating the recording instruments at those stations.

The City of San Francisco Public Utilities Commission, Hetch Hetchy Water Supply, has continued to cooperate with the Water Supervision engineers by maintaining, operating and compiling records from a series of stream gaging stations on the San Joaquin and Tuolumne rivers in the San Joaquin Valley.

The United States Bureau of Reclamation, through its offices at Sacramento and Merced, cooperated by operating certain recorder equipped stations and by furnishing records of flow at certain stations.

The final computations of the diversion quantities, as shown in this report, are the result of giving full consideration to all measurements and records of operation during the entire season for each individual diversion.

The specific degree of cooperation by these agencies with the Water Supervision engineers is detailed in footnotes on the many stream-flow tabulations contained in this report.

SHASTA AND FRIANT RESERVOIR OPERATIONS

Shasta Reservoir on the Sacramento River above Redding was first used to store water for irrigation use during the winter of 1943-44 and releases for supplemental irrigation water along the Sacramento River commenced in the late spring of 1944. The release of water from the reservoir since 1944 has substantially changed the natural regimen of flow of the Sacramento River and in many respects greatly benefited conditions along that stream. However, it also has created added diversion problems.

Friant Reservoir (Millerton Lake) on the San Joaquin River near Friant was first used to store water for irrigation use during the winter and spring of 1943-44 and the first releases for supplemental irrigation water occurred during 1944. Releases were made during 1950 for regulating and supplementing the irrigation supplies along the San Joaquin River.

The operations of the Shasta and Friant reservoirs are directed by the United States Bureau of Reclamation.

Reservoir Data

Shasta Reservoir is created by a gravity concrete dam, 528 feet high above streambed, located 13 miles upstream from Redding. The gross capacity of the reservoir with spillway gates closed is 4,500,000 acre-feet, of which a space of 4,000,000 acre-feet will be available for the active storage of water and 500,000 acre-feet of space will be reserved for silt deposits and to create head for the generation of power. The spillway steel drum gates were installed in 1948, thus providing a storage of 786,000 acre-feet above the 3,714,000 acre-feet at the fixed crest of the spillway. The ultimate storage capacity will be filled every year when the natural stream runoff from above the dam is equal to or exceeds the normal amount. Water from the reservoir is conveyed through the Sacramento Valley in the channel of the Sacramento River.

Friant Reservoir, on the San Joaquin River, is created by a gravity concrete dam about 275 feet high above streambed, and is located at the base of the foothills about 20 miles northeast of Fresno. The gross capacity of the reservoir with spillway gates closed, is 520,000 acre-feet, of which a space of 404,000 acre-feet between the top of the spillway gates at elevation 578 and the bottom of the Friant-Kern Canal outlet at elevation 459.4 feet will be available for the storage of water for flood control and to supply irrigation demands in the San Joaquin Valley. It is planned to ultimately convey the major portion of the water from Friant Reservoir through the Madera and Friant-Kern canals to lands north and south of the San Joaquin River in Madera, Fresno, Kings, Tulare and Kern counties. The spillway gates on Friant Dam were completely installed in 1948, thus providing a storage of 84,000 acre-feet above the 350,000 acre-feet of space between the fixed crest of the

spillway at elevation 560 feet and the bottom of the Madera Canal outlets at elevation 442.2 feet. Construction on the Friant-Kern Canal was essentially completed during 1950 except for bridges, turnouts, etc. Water reached the end of the canal in the vicinity of Bakersfield; however, the most southernly point of delivery was to the Southern San Joaquin Municipal Utility District in the vicinity of the City of Delano. The quantity of diversions into the Friant-Kern Canal is shown in Table 172.

Shasta Reservoir Operation - 1950

The Shasta Reservoir has been constructed for multiple uses. It is designed to furnish water for (1) irrigation in the Sacramento and San Joaquin valleys, including the Sacramento-San Joaquin Delta area; (2) salinity control in the Delta by maintaining a flow in the lower Sacramento River sufficient to repel the intrusion of salt water from Suisun Bay; (3) navigation on the Sacramento River above Sacramento to Chico Landing; and (4) the generation of hydroelectric power. The reservoir will also be used to control floods in the Sacramento River originating above Shasta Dam.

Although the storage of water in the reservoir commenced in the early part of the winter of 1943-44, the ensuing season's subnormal runoff into it was not sufficient to fill the reservoir to the spillway lip. However, the United States Bureau of Reclamation was able to release sufficient stored water throughout the irrigation season of 1944 to augment the natural stream flows and thereby facilitate diversions of those natural flows by the diverters along the Sacramento River.

Since 1944, including 1950, the quantity of water in storage in Shasta Reservoir was sufficient to afford releases (1) to facilitate irrigation diversions by maintaining higher river levels along the Sacramento River, (2) to sustain minimum flow for navigation of approximately 5,000 second-feet upstream from Knights Landing, (3) to supplement irrigation supplies in the Delta area below Sacramento, and (4) to control salinity. During 1950, a year of 77 percent of normal runoff to the Delta, releases from the reservoir were regulated to maintain a stream flow out of the Delta into Suisun Bay sufficient to hold back the line of excess saline concentration to an arc embracing 5,000 acres of the lower Delta area.

The daily total mean-second-foot-flows into Shasta Reservoir during 1950 are given in Table 7. These inflows to the reservoir, as shown by the daily figures, represent the amounts of water that would have been flowing in the Sacramento River at the dam site if the dam had not been built. The inflow figures are computed by combining the effects of daily change in storage, reservoir evaporation, releases and spill.

A tabulation of the daily amounts of water in storage in Shasta Reservoir during 1950 is given in Table 8. The daily mean-second-foot-flows as measured below Shasta Dam at the United States Geological Survey station near Keswick are given in Table 9. The flows at the Keswick station are the same as the releases from Shasta Reservoir except for

the amounts of inflow between the station and Shasta Dam. The amounts of this inflow are small during the irrigation season, and can be ignored, so that the flows at the gaging station can be assumed the same as the releases from the reservoir during that period.

A chart depicting the operation of Shasta Reservoir for 1950, as prepared by the U. S. Bureau of Reclamation, giving the inflows to the reservoir, the amounts released, the water surface elevations and the amounts of water in storage, is shown on Plate 2.

Friant Reservoir Operation - 1950

The Friant Reservoir will be used only for the storage of water for flood control and irrigation purposes. The daily total mean-second-foot inflows to Friant Reservoir during 1950 are given in Table 103. A tabulation of the daily amounts of water in storage in the reservoir during 1950 is given in Table 104. The daily mean-second-foot-flows, as measured at the United States Geological Survey gaging station below Friant, are given in Table 105. These flows are the same as the releases from Friant Reservoir except for the amounts of inflow between the station and Friant Dam. The amounts of this intermediate inflow are small during the irrigation season so that the measured flows at the gaging station are practically the same as the releases from the reservoir during that period. A chart depicting the operation of Friant Reservoir for 1950, as prepared by the U. S. Bureau of Reclamation, giving the same data as are shown by the chart for Shasta Reservoir, is also shown on Plate 2.

During the 1950 irrigation season, water stored in Friant Reservoir (Millerton Lake) was released into the Madera Canal, the Friant-Kern Canal, and into the channel of the San Joaquin River. Diversions by the Madera Canal served largely to aid in the replenishment of ground water supplies in the Madera area. The regulated releases flowing down the San Joaquin River served not only the irrigation requirements of the lands along that stream above the head of the gravelly Ford Canal, but also the requirements of the numerous diversions below that point to Temple Slough.

RUNOFF AND WATER SUPPLY

The variable flows of the streams entering the Sacramento and San Joaquin valleys on the north and east sides result from the rainfall runoff occuring each winter and spring season principally from December to April, the snow melt runoff occurring during the spring and summer seasons from March through June, and a combination of runoff from perennial springs and released stored water during the summer and fall seasons. Flood flows in the valley floor channels are caused by runoffs from rainfall and melting snow in the mountain areas in excess of mountain reservoir capacities, and by rain storm runoff from the vast area of minor foothill watersheds and valley floor lands. Some incidental flood control is accomplished by reservoirs in many of the tributary watersheds including those of the Sacramento, Feather, Yuba, Stanislaus, Tuolumne, Merced and San Joaquin rivers.

The flood flows during November and December, 1950, were the highest flows of record on the American, Cosumnes, Mokelumne, Stanislaus, Tuolumne, Merced, Kings, Kaweah, Tule, and Kern rivers. As established by the U. S. Geological Survey, the magnitudes of these flood crests are given in the following tabulation:

Stream and Station	Date and Crest in Second-Feet of Previous Flood		Date and Crest in Second-Feet of 1950 Flood	
American River at Fair Oaks	3/26/28	150000	11/21/50	180000
Cosumnes River at Michigan Bar	3/31/40	26200	11/18/50	27600
Mokelumne River at Woodbridge	3/25/28	25600	11/21/50	27100
Stanislaus River below Melones	3/31/40	22800	11/21/50	49500
Tuolumne River at La Grange	1/31/11	60300	12/8/50	65000
Merced River below Exchequer	1/17/16	22000	11/19/50	46200
Kings River at Piedra	12/11/37	80000	11/19/50	91000
Kaweah River at Three Rivers	12/11/37	33300	11/19/50	52000
Tule River near Porterville (above South Fork)	3/9/43	15500	11/19/50	25500
Kern River near Bakersfield	3/9/43	21700	11/19/50	36000

Levee breaks and consequent flooding of low lands occurred in the lower reaches on all of the above mentioned streams. Where flooding in the vicinity of some gaging stations occurred, it was necessary to establish the crest flows by slope-area extrapolation of the rating curves and by log-log plottings of flow and stage relations. Many current meter flow measurements were made by Water Supervision and cooperating agencies at these and at other stations along the valley floor streams at or near the flood crests to give a more definite determination of the crest flow values shown above.

A detailed description of the storms and a summarization of the flood conditions occurring during the November 13 to December 15 storm period are contained in a special report of the Division of Water Resources entitled, "Floods of 1950 in California," dated December 18, 1950.

The extent of the flood flows in 1950 is given by the tabulations of daily stream flows, Tables 9 through 149.

During the summer irrigation season, variations in flow of the streams on the valley floor are affected, (1) by the combination of diversions from the streams for irrigation and of accretions to the streams from both direct surface drainage and seepage from ground water, and (2) by releases of stored water for irrigation, navigation, salinity control and the generation of electric power.

1950 Inventory of Runoff

A comprehensive summary and inventory of the monthly stream flows, diversions and accretions, in acre-feet, is contained in Tables 2, 3 and 4. This inventory is arranged to give these data for each reach of each stream covered by Water Supervision work in a summarized ready-reference form. The inventory is designed to give a picture of the complete disposition of the season's water supply, with stress upon the amounts of losses or gains in flow along each reach of each stream.

1950 Runoff Comparisons

A comparison of the unimpaired flows for the period 1920-1950, in the major streams tributary to the Sacramento and San Joaquin valleys in percent of a 60-year normal is given in Table 1. This table was re-computed this year from original data furnished by the Snow-Survey section of this Division which were based on a 60-year (1889-1949) normal runoff. The annual runoff figures given in Table 1 have been modified by as much as 5 percent from the corresponding figures given in Table 1 of the previous Water Supervision reports. These changes were the result of the change from a 50-year normal to a 60-year normal and of the ommission of the runoff from the Calaveras, Cosumnes and Bear rivers in the computations of the new 60-year normal runoff of Sacramento-San Joaquin rivers to Delta. As shown in Table 1, the 1950 unimpaired runoff may be summarized as follows:

Stream and Station	Percentage of 60-year normal
Sacramento River at Red Bluff	66 percent
Sacramento River at Sacramento	77 percent
San Joaquin River at Friant	70 percent
San Joaquin River at Vernalis	76 percent
Sacramento and San Joaquin rivers flow to the Delta	77 percent

A comparison of the season's actual minimum flows is given in Table 196. The minimum 10-day-flows during 1950 are shown to have been:

Stream and Station	Average minimum 10-day flow
Sacramento River at Sacramento	7,080 second-feet
San Joaquin River at Vernalis	502 second-feet
Combined Sacramento and San Joaquin rivers flow to the Delta	7,670 second-feet

These comparisons indicate that the water supply available during the 1950 season was subnormal. However, the water supply for the calendar year of 1950 was above normal because of the excessive precipitation which occurred in November and December as

shown in the precipitation data presented on page 32 of this report. Observations of water utilization and the amounts of residual flows in the streams reaching the Delta in the 1950 growing season indicated that the demands for irrigation and salinity control in the Delta exceeded the natural flow supplies, and the releases of stored water from Shasta Reservoir were of primary importance in maintaining satisfactory river flows and fresh water conditions in the Delta.

Primary Irrigation Supplies

The flows onto the valley floor during the summer season through the major streams are considered to be the primary water supplies for irrigation. This primary water is differentiated from the flows available for irrigation in the lower reaches of the streams resulting from large accretions including the return of a substantial amount, through drainage, from the flows diverted for irrigation upstream. The amounts of primary water available for irrigation in the Sacramento Valley are given in the flow tabulations for those gaging stations located at the edge of the valley floor, to wit, tables numbered 9, 56, 63, 64, 78, 86 and 92.

In the San Joaquin River service area, primary water supplies are almost entirely diverted from the upper reaches of the Stanislaus, Tuolumne and Merced rivers by the large irrigation districts, and from the San Joaquin River in the vicinity of Mendota by the large canal companies. These upper diversions from the Stanislaus, Tuolumne and Merced rivers are included in Tables 177, 175 and 174, respectively. Primary water supplies in the San Joaquin River for irrigation below Friant are measured at the San Joaquin River gaging station below Friant, Table 105.

Accretions to Stream Flow

As evidenced by the data for stream flow and diversions, summarized in Tables 2, 3 and 4, there are large quantities of accretions to the flows of the streams and channels in their courses across the valley floors. These accretions are of major importance as available irrigation supplies. They are made up of measured flows from surface drains and of many other flows, not susceptible to direct measurement, from minor ephemeral streams, from scores of small surface drains, from seepage and return of percolated irrigation water and from escaping underground water normally present as the result of percolated rainfall on the valley floor. The amount of total accretion along any stream reach is the summation of amounts of measured drains plus unmeasured accretions, as shown in these tabulations.

During the summer season a large portion of the accrete water is derived from upstream irrigation returning to the streams either as surface drainage or waste into open drains or as deep percolation to the ground water from which it finds its way to nearby streams or drains.

Throughout the year, along certain reaches of the stream, the flows are augmented by outflows from seepage of the natural ground water. This portion of the ground water, which is independent of irrigation as a source, is replenished from two other sources, (1) rainfall on the valley floor, a portion of which percolates to the water table during periods of abundant precipitation, and (2) infiltration and escape from stream channels through the banks during high flood flow conditions, later to partially return to that stream when its water levels recede to low flow conditions of the summer and fall.

The figures shown in all reports prior to 1947, giving the relation of "return water in percent of diversion" as discussed under heading "Drainage and Return Water", may be misleading inasmuch as all accretions, heretofore referred to as "return water", actually may include substantial amounts of ground water seepage not derived from upstream irrigation and unmeasured contributions from small tributaries.

Sacramento Valley Accretions. In the Sacramento Valley all of the accretions to natural and regulated flows which are not diverted on lands north and west of the Sacramento Delta flow into the Delta and are available for use in that area. Practically all of the summer accrete flows in Colusa Trough, Back Borrow Pit, Knights Landing Ridge Cut, and Yolo By-Pass are mainly return waters derived from diversions from the Sacramento River. Since the Sacramento River is the main stream through the Sacramento Valley the accretions to that stream include substantial amounts of return water from irrigated areas served by water from other sources, particularly the Feather River. A large part of the summer return water flows reaching the Sacramento River through the Butte Slough Outfall Gates (Mile 84.0L) and from Sutter By-Pass through Sacramento Slough (Mile 21.2L) are of Feather River origin. However, the measured flows in Sacramento Slough, Table 55, include not only return water from Feather River diversions but also return water from Sacramento River diversions into Reclamation District No. 1500, Table 54. In Water Supervision reports prior to 1947 estimates are given showing that bank seepage into the West Borrow Pit of the Sutter By-Pass from R.D. 1500 amounts to 10 percent of that district's diversions from the Sacramento River.

Along the Sacramento River between Colusa and Red Bluff there are no large well defined artificial drainage channels. Records or estimates of natural inflow to the Sacramento River from streams in this stretch were, however, obtained where available. Above Red Bluff to Redding there is considerable drainage water from the Anderson-Cottonwood Irrigation District, but it is not recorded.

Along the Feather River, during years of subnormal water supply, practically all of the primary regulated water is diverted upstream from, or at, the Sutter-Butte diversion dam, yet accretions accumulated below that point in amounts sufficient to afford a limited supply for all diversions.

Table 2 is designed to give a summary not only of monthly flows measured on the Sacramento Valley floor but also the computed monthly amounts of accretions (or losses, as shown by a minus sign preceding the figure) occurring along each reach of each stream between gaging stations. At the end of each series of data for one stream, as shown in Table 2, there are summations of diversion and accretion quantities.

In order to compare 1950 season conditions along the Sacramento River with those of previous years, the following tabulation gives the seasonal accretions, July through September, in percent of simultaneous diversions. This tabulation, in part, is excerpted from Table 147 in the 1946 Water Supervision Report. The figures for 1947, 1948, 1949 and 1950 were derived from the summation data in Table 2 in each report, but under the same provisions detailed in the "note" under the 1946 Table 150.

Comparative Seasonal Accretion Percentages - 1938 - 1950

Sacramento River - Red Bluff to Sacramento

Year	Seasonal Runoff at Red Bluff in per cent of 60 year Normal	Accretions in per cent of Diversions* July through September
1938	169	64
1939	50	36
1940	121	40
1941	165	56
1942	130	56
1943	98	53
1944	54	49
1945	77	43
1946	93	51

1949	70	58
1950	66	63

*Excludes City of Sacramento municipal.

It is apparent from the above tabulations that there are variations in the accretion percentages with relation to the seasonal runoffs. However, a definite trend in this relation indicates that summer accretions to stream flow on the Sacramento Valley floor are influenced not only by return water from irrigation but also by natural ground water seepage. Ground water seepage, as indicated by the above accretion ratio, is observed to be accelerated during those summer seasons which follow late and abundant spring rains on the valley floor.

San Joaquin Valley Accretions. The summer and fall season stream flows in the lower San Joaquin River and its tributaries on the valley floor consist mainly of accrete flows derived to a large extent, from irrigation water returning to the stream channels by way of percolation into the ground water and the latter's seepage into the channels. The exceptions to this condition are on the Tuolumne and Stanislaus rivers when irregular releases for power generation below upstream diversion points further augment the flows.

The channels of the Stanislaus, Tuolumne and Merced rivers in their westward flow across the valley floor from the foothills are in deep degraded canyons between more or less sheer bluffs rising from 10 to 50 feet to the predominant level of the upper plains of the valley floor. The plains areas are intensively irrigated with regulated gravity water supplies derived from the upper reaches of the same streams. Thus, an abundant water supply in normal years, a deep and permeable soil and the deep river channels are all conducive to relatively steep slopes of the ground water table toward the rivers and the consequent high rate per mile of accretions to the stream flow.

The channel of the San Joaquin River between Friant and the valley trough near Mendota passes through the plains area in a deeply degraded canyon 10 feet to 100 feet deep between relatively sheer bluffs. The plains area along the south side of this reach is intensively irrigated with Kings River water through the Fresno Irrigation District distribution system. On the plains along the north side of this reach in Madera County irrigation water is derived mainly from ground water, except where occasional parcels are served with pumped river water. Because of the fact that the elevation of the ground water plane on the south side is above the riverbed and along the north side it is below the bed, there are accretions from the south and losses to the north along this reach of the San Joaquin River. The losses during the 1950 season exceed the accretions as shown in Table 3.

The Tule River debouches onto the valley floor in the vicinity of Porterville through a shallow meandering channel. The bed of the channel as it crosses the valley floor is made up of unconsolidated sediments with high permeability. This latter fact accounts for the heavy channel losses along Tule River as shown in Table 4.

The magnitude and importance of these accrete waters in the San Joaquin Valley as a water supply is brought out in Table 3. There does not appear to be as definite a relation of accretions with respect to diversions along these San Joaquin Valley streams as exists in the Sacramento Valley. This lack of a relation may be due, (1) to the considerable lag between the time diversions are made from the streams for storage in terminal reservoirs (Woodward, Dallas-Warner, and Owens) and the time a portion of those waters return to the stream channels after having been applied for irrigation, and (2) to the prevailing climatic effects upon rainfall, humidity, transpiration and evaporation.

The ratio of accretion (including return water from irrigation) to diversions along the lower San Joaquin River and its tributaries, Stanislaus, Tuolumne and Merced rivers, is considerably smaller than that for the Sacramento River. Analysis of pertinent data in Table 3 and comparison with the data contained in Table 147 of the 1946 Water Supervision report indicate this San Joaquin Valley ratio to vary between 19 and 35 percent while the foregoing table on page 27 shows the Sacramento Valley ratio to vary between 36 and 64 percent. This difference may be attributed to the fact that, whereas, due to basin topography and geology, practically all drainage from the Sacramento River diversions is

quickly returned to the river, considerable of the return water in the San Joaquin Valley may never reach the surface streams because of its percolation to ground water and its immediate recovery by drainage and deep well pumps in the areas of many of the irrigation districts for re-use through the irrigation canals.

Stream Flow Measurements

Many of the stream gaging stations, the records from which are reported herein, are maintained, operated and rated, and the flows at them are computed, by agencies co-operating with the work of the Sacramento-San Joaquin Water Supervision. The methods used by all cooperating parties are standardized and the results obtained are equally good. In order to obtain uniformity, however, the Water Supervision engineers cooperate with the other agencies in obtaining and correlating the records for each of the cooperative stations.

During the 1950 season, 65 of the total of 145 gaging stations on streams and drainage channels for which records are reported herein were maintained, operated and rated, and the flows at them were computed, solely by the Division of Water Resources through the Water Supervision and Flood Control organizations.

An automatic water stage recorder is in operation at each of the gaging stations used in this work. The continuous records of water surface elevations at the stations serve two major purposes in the preparation of the data presented in this report. First, the actual water surface elevations at two adjacent stations on a stream afford the means of obtaining the water surface elevations at the pumping plants along the stream between those stations. These elevations give the pumping heads, which heads, in turn, become factors in determining the rates of diversion by the pumping plants. Second, the water surface elevation (gage height) is a factor in determining the flow of the stream, in second feet., passing the station.

A stream-flow rating is made for each gaging station. This rating gives the flows in second-feet for each gage height at the station. Normally this gage height-flow relation, or rating, is more or less permanent where there is a fixed channel and a fixed flow regimen at the station. The rating varies however where the bed of the channel is of loose shifting sand, or heavy weed growth accumulates as the season progresses, or where there may be backwater effects from downstream conditions. In this latter case more frequent measurements of flow are made to obtain accurate records of the flows passing the stations.

Water surface elevations at any time at certain gaging stations may be derived by the reader by using Table 6 coupled with the appropriate stream-flow data in Tables 9 through 149. From the stream flow table the flow on any desired day is interpolated into the specific station's rating table in Table 6 to give a gage height (or elevation) of the stream's water surface for that day.

Preliminary Data from Cooperating Agencies

Some of the stream-flow records submitted by cooperating agencies and included in this report must be considered "Preliminary Data" since this report is published prior to final preparation of the data for publication by those agencies. This condition is particularly true with respect to some data furnished by the U. S. Geological Survey.

Stream Flow Bulletins

During 1950, stream-flow bulletins were compiled from time to time and mailed to interested agencies and persons. The bulletins listed the results of stream-flow current meter measurements made along the Sacramento and San Joaquin river system on the valley floor by Division of Water Resources (Sacramento-San Joaquin Water Supervision) and U. S. Geological Survey engineers.

Notes on Certain Gaging Stations

Records are obtained and published in this report for 145 gaging stations in the Sacramento and San Joaquin valleys, including 16 stations not heretofore published in this series of reports. A brief description of each station is given at the bottom of the stream-flow data table. The location of each station is shown on Plate 3 in the pocket on the back cover of this report. Notes on the newly included stations, together with a repetition of notes on the Sacramento River at Sacramento, are believed desirable, however, for a better understanding of the records. These notes are as follows:

Sacramento River at Sacramento. The method of computing daily mean flows at this station, beginning with 1947, has been radically changed. Heretofore, as shown in reports prior to 1947, the low flows which are affected by tidal action, were derived from (1) the records of flows at Verona on the Sacramento River and at H Street Bridge on the American River and (2) records of diversions from and drainage to the rivers between those two upper stations and the I Street Bridge at Sacramento. The method previously used did not take into account unmeasured accretions or losses in the reach between Verona and I Street Bridge and in the American River below H Street.

The procedure employed in 1947 through 1950 involves the computation of daily mean Sacramento River flows passing Sacramento by the usual and standard practice of rating the stream, at the I Street Bridge station by means of the slope-velocity method. This method requires a consideration of the gage heights recorded at the river gaging station at Snodgrass Slough (20 miles downstream from Sacramento) as well as the recorded gage heights at Sacramento. The adaptation of this method in 1947 as a means of direct rating, was accepted after Water Supervision engineers had measured and studied the problem with this method in mind for the previous three years.

The final relation for tidal influenced flow conditions at Sacramento involves the construction of a rating curve having as the ordinate the difference between the gage heights at Sacramento and at Snodgrass Slough and as the abscissa a function of velocity (fV) equalling the discharge (Q) divided by the gage height at Sacramento. Flows, in

second-feet, passing Sacramento are obtained from this relation by multiplying the scale value of fV for any differential gage height, by the corresponding gage height at the I Street recorder. This relation is used for gage heights at Sacramento below 10.5 feet (a flow of 33,000 second-feet) below which tidal fluctuations are effective.

The flows for gage heights below 10.5 feet follow the exponential relation

$$Q = 1612\ (\text{I Street recorder G.H.} + 3.10)(\text{Differential} - 0.50)^{0.25}$$

where "Differential" =(I Street recorder G.H. + 3.10) minus (Snodgrass Slough G.H.).

The flows for gage heights above 10.5 feet follow the exponential relation

$$Q = 288\ (\text{I Street recorder G.H.} + 8.50)^{1.61}.$$

Tidal fluctuations cease above the 10.5-foot stage and this latter flow-stage relation exists.

Frequent current meter flow measurements, including tidal cycle measurements, were made during the past four years to delimit the above relationships, and to evaluate any shifts that may occur in the flow-stage relationship due to dredging activities in the channel.

Minor Tributaries to Sacramento River. Five stream-flow stations, which were operated under Contract No. 3-170, were discontinued during 1950. The short records for these discontinued stations demonstrated that their flows were so small as to not warrant recordation. The five stations are located on: Craig Creek, Butler Slough, Irrigation Drain into Antelope Creek, Champlin Slough and Toomes Creek.

Additional Stations Reported in 1950. The following stream-flow stations, and including Tulare Lake water elevations, for which data have not been heretofore published in the reports of the Sacramento-San Joaquin Water Supervision, are included in the 1950 report. These stations, numbering 17 in total, were included to provide runoff data for the minor stream systems. Nine of these stations are maintained and operated by the Division of Water Resources.

Dry Creek near Wheatland
Reclamation District 1001 Drain at head of Cross Canal
Pleasant Grove Creek at Lincoln Road
Pleasant Grove Creek at Reclamation District 1000 Drain
Duck Creek at Farmington
Duck Creek near Stockton
Lone Tree Creek near Valley Home
Lone Tree Creek near Manteca
Tempo Creek near French Camp
French Camp Slough near French Camp
Fresno River near Daulton
Chowchilla River near Buchanan Dam Site
Kings River at Piedra

(Tabulation continued on next page)

Kaweah River near Three Rivers

White River near Ducor

Kern River near Bakersfield

Tulare Lake Elevations

A brief description of the location, the cooperative agency involved, the drainage area where applicable, and the period of record may be found in the footnotes under the respective table of flows for each of the stations listed.

Precipitation

In the Central Valley of California direct precipitation is a negligible source of water supply for growing crops during the late spring, summer and fall seasons. During the early irrigating season, however, the attendant cooler temperatures and higher humidities of rain storms substantially reduce the demand for irrigation diversions, and are two of the main factors affecting the variations in demand in the same month from year to year.

The following tabulation gives the 1950 monthly total precipitation at representative valley floor rainfall stations and the monthly normals. Records are from U. S. Weather Bureau.

Station	Inches of Precipitation - 1950												
	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Annual
Red Bluff - 1950	5.48	4.33	2.05	.33	.60	.21	.00	.05	.17	3.53	2.20	4.56	23.51

*New station at D Street Bridge. Normal shown is for 1948 at old station.

It can be seen from these data that Central Valley floor precipitation averaged 124 percent of normal for the 1950 calendar year. During the months of October, November, and December, rainfall in excess of normal occurred at all Central Valley stations.

USE OF WATER FOR IRRIGATION

The prevailing warm temperatures and a prolonged frost-free period during the summer season in the Sacramento and San Joaquin valleys favors the profitable production of wide variety of marketable crops in large quantities. The availability of irrigation water during the dry summer season affords continuous growing conditions necessary for the many crops.

The major irrigated crops in the Sacramento Valley include rice, alfalfa and clover, citrus and orchard fruits, nuts, grapes, hops, truck crops, and field crops; in the Delta area they include alfalfa, orchard fruits, corn and truck crops; and in the San Joaquin River and tributaries service area they include grapes, nuts, orchard fruits, cotton, alfalfa and clover, truck crops, corn, grain, flax and pasture.

Irrigation Diversions

Measurements and records of diversions in 1950 have included all of the points of diversion on the valley floor along the Sacramento River and its tributaries; along the Cosumnes, Mokelumne, and Calaveras rivers; along the upland banks of the delta channels of Old San Joaquin River, Tom Paine Slough and San Joaquin River; along the Stanislaus, Tuolumne and Merced rivers and Dry Creek tributary to Tuolumne River; along the San Joaquin River between Friant Dam and Durham Ferry Bridge (Vernalis); along Fresno Slough and Fresno Slough By-Pass; and along Tule River.

This report contains records of a total of 1040 points of diversion segregated to various sources as follows: Sacramento River 305, Colusa Trough (above Colusa-Williams Highway Crossing) 24, Back Borrow Pit (extension of Colusa Trough along back levees of Reclamation Districts 108 and 787) 37, Knights Landing Ridge Cut 9, Yolo By-Pass 12, Cache Slough 1, Lower Butte Creek and Butte Slough 30, Sutter By-Pass and Sacramento Slough 58, Feather River 43, Yuba River 13, Bear River 5, American River 24, Cosumnes River 17, Mokelumne River 7, Calaveras River (including Mormon Slough) 52, Tom Paine Slough 8, Old San Joaquin River 17, San Joaquin River (below Vernalis gaging station) 58, San Joaquin River (between Vernalis gaging station and Fremont Ford Bridge) 34, San Joaquin River (between Fremont Ford Bridge and Friant Dam) 99, Fresno Slough and Fresno Slough by-Pass 14, Merced River 77, Tuolumne River 35, Dry Creek (tributary to Tuolumne River) 11, Stanislaus River 36, and Tule River 14. The locations of these points of diversion are shown on Plate 3 in the pocket at the back of this report.

All of the diversions, except 47 by gravity, are accomplished by pumping. The records of diversion by gravity are obtained by means of canal ratings established by flow measurements. In the case of the pumping diversions there are a few instances where the records are obtained by means of canal ratings but, in the main, the records are obtained from a relation established between electric power consumption, static head and plant efficiency. This is made possible by the fact that nearly all of the pumping plants are electrically operated. The relation between water pumped and power input is determined

from current meter measurements of the discharge and the measured kilowatt input. At the larger pumping plants several measurements are made during each season. At the smaller plants a number of measurements are made initially to determine the ratings and thereafter measurements are made at intervals to discover any changes which may occur in the ratings. Due to intermittent operation of the smaller plants and the large area to be covered by the field engineers, it is not possible to make many discharge measurements at any one of them. However, it is believed that the rating, as initially determined, remains more or less constant and that over a period of time enough measurements are secured to determine any change in the rating. All rating measurements made by owners or cooperating agencies have been given full consideration in the final computations of the amounts of water diverted by each individual plant.

Prior to 1933 a daily diversion record for each plant was compiled. However, since that year, except for some of the larger plants, the monthly diversion records only are available. The diversions for 1950 have been computed on a monthly basis only, and the breakdown into daily records was not made. The monthly amounts of water diverted at the individual points of diversion along all of the streams covered by the Water Supervision work are given in Tables 152 through 178.

Prior to 1947 the monthly amounts of diversions in acre-feet by the large east-side irrigation districts from the Stanislaus, Tuolumne and Merced rivers were published annually in this series of Water Supervision reports and are found in the 1946 Table 154. The amounts of these diversions during 1950 are shown in Tables 174, 175 and 177. The amounts of these diversions during the 1947 season were omitted from the 1947 annual Water Supervision report but are included in the 1948 report in Table 139, specially prepared to supplement the 1947 report.

Fresno Slough and Fresno Slough By-Pass normally convey excess Kings River water flood flows into the San Joaquin River at a point above Mendota Dam, but during the irrigation season San Joaquin River water is backed up through those channels by the Mendota Dam to afford irrigation supplies to the James and Tranquillity irrigation districts and to certain other diverters. The diversion and irrigated acreage data for these streams shown in Tables 172 and 173 were furnished by the U. S. Bureau of Reclamation.

Table 157, diversions and irrigated acreage by Reclamation District No. 2068 from Cache Slough, is included in this report to continue a similar record commenced in 1948. The irrigated area in the District lies outside of the established boundary of the Delta shown on Plates 3 and 4 and can be classed as a "Delta Uplands" area. The purpose of including Table 157 in this 1950 report is to present as full a record as is available of the use of water in and from the Delta, in conjunction with the Delta crop survey data in Table 198 of this report.

A seasonal summary of water utilization during the past ten years, 1940 through 1950 from the Sacramento River and its tributaries and the San Joaquin River and its

tributaries is shown in Table 151. This table presents an overall picture of the water utilization in these areas.

In Table 179 there are shown the average monthly diversions in percent of the seasonal for the streams in the Sacramento and San Joaquin valleys. A summary of the monthly diversions from the Sacramento and San Joaquin valley streams for the ten-year period, 1941 through 1950, is given in Tables 180 through 190. Table 190 shows, for the Sacramento River only, the seasonal diversions and acreages irrigated for the period 1940 through 1950, segregated to the different river sections.

Irrigated Acreage

Toward the end of the irrigating season in 1948, as was done in previous years, a complete canvass was made of acreages irrigated from each of the points of diversion covered by the Water Supervision work. The irrigated acreages for all of the points of diversion on the streams on the Sacramento and San Joaquin valley floors were plotted on suitable maps and are retained on file in the office of the Division of Water Resources for record.

The area irrigated through each individual point of diversion along the streams covered in this work is given in Tables 152 to 178 inclusive. These tabulations and the associated summarizing tables do not include data on diversions and use of water in the Delta.

The following is a summary of the total acreage irrigated during 1950 in the area covered by the Water Supervision work as shown in Table 5. This tabulation, as noted in the footnotes of Table 5, does not include the acreage of the large east-side irrigation districts in the lower San Joaquin Valley. Detailed acreage tabulations of the totals shown below, as well as those of the large irrigation districts mentioned, may be found in Tables 151 through 178 and in Table 198 (Delta Crop Survey) of this report.

Area	1950 Irrigated Acreage	
Sacramento Valley Floor above Sacramento	401,659	
San Joaquin Valley Floor above Delta	483,105	
Total area served by measured diversions		884,764
Sacramento-San Joaquin Delta		
Cropped	365,800	
Water Consuming--not cropped	82,500	
Total Delta		448,300
Grand Total		1,333,064

Table 192 shows a comparison of the acreage of rice irrigated during the period 1924 through 1950 from the stream channels within the Sacramento and San Joaquin valleys which are covered by Water Supervision work, and the total acreage of rice in California irrigated from all sources as reported by the Federal-State Crop Reporting Service.

In view of the methods of farming, which usually employ rotation of crops with summer-fallow, it is probable that the acreage of land under irrigation facilities in the area covered by the Water Supervision activities exceeds 1,400,000 acres.

1950 Sacramento-San Joaquin Delta Crop Survey

A complete survey of the acreages of crops, including both irrigated and non-irrigated, in the Sacramento-San Joaquin Delta was made during November and December of 1950, January and February of 1951, as called for in the State-Federal contract described in the "Foreword" of this report. The crop segregations were plotted on a series of suitable maps of the Delta islands which are on file with the Division of Water Resources. Similar surveys of the Delta area had been made previously, the last one in 1948. All of the 1950 Delta acreage data are tabulated in Table 198 to be found in the pocket on the back cover of this report. That table gives the acreage of each cultivated or uncultivated crop segregated as to tracts and islands.

The total water consuming area of the Delta is segregated for 1950 as follows:

Total irrigated cultivated crops, not including double- or inter-crops	365,800 acres
Total idle lands below 5.0 feet in elevation, including interior water surfaces	42,900 acres
Total exterior channel water surfaces	37,600 acres
Small islands (est.)	300 acres
Total brush and trees in exterior channels (est.)	1,700 acres
Total water consuming area, 1950	448,300 acres

These data are similar and are comparable to data in Table 148 of the 1948 Water Supervision report.

Use of Water in Delta

Previous Water Supervision annual reports have included considerable analyses of the utilization of water in the Sacramento-San Joaquin Delta. The work of Water Supervision does not cover the delta area to the extent of measuring flows in the numerous interconnected channels or quantities of water diverted for irrigation, but periodically, surveys have been made of crops and irrigated acreages. Special investigations of the Delta irrigation problems have been conducted and the results therefrom have been reported in previous reports.

In previous years, in which crop surveys were made, the total consumptive use of water has been segregated to show the use in each river delta. There was also shown a classification of the irrigated crops with respect to the peat and sedimentary soils on which they were produced.

Gross Duty of Water

The term "gross duty of water", as used in this report, is defined as being the total amount of water diverted to serve one acre of irrigated land. The gross duty for any particular period may be expressed as the amount of water diverted in acre-feet per acre irrigated, or, conversely stated, may be expressed as the number of acres irrigated per one second-foot average diversion rate. The gross duty of water does not include solely the net amount of water consumed by plants in their processes of transpiration and growth, but also includes all irrecoverable losses through evaporation and deep percolation, plus canal and conveyance losses, and those amounts of water which act as a necessary vehicle to carry irrigation heads across porous soils or to maintain fresh water ponds in the growing of rice and which return to some river or drainage channel, with little loss, to become available for re-use.

Gross duty of water figures for the individual stream channels covered by Water Supervision work are given for the Sacramento and San Joaquin valleys in Table 141.

SALINITY INVESTIGATIONS

The intrusion of salty water from San Francisco Bay into the channels of the Delta from which irrigation supplies are derived, is a matter of extreme importance and the Water Supervision work has included observations during 1950 of the saline content of the water at several stations throughout the Delta and upper San Francisco and Suisun Bay areas, with cooperation from the U. S. Bureau of Reclamation.

Purpose

The purpose of the salinity investigation, as outlined in previous reports, has been to record the occurrence and extent of salinity encroachment from San Francisco Bay, and to establish the relation between movement of salinity, stream flow to the Delta, and tidal action. As reported in Bulletin 27 of the Division of Water Resources, this relation was established for the conditions which obtained during the period of the special investigation for that bulletin and upon the basis of all data available at that time. Subsequent investigations, therefore, have been directed to the maintenance of an unbroken record of the salinity, tidal and stream flow variations, essential not only in the corroboration of the relation presently established, but as the basis for a check of possible modifications in the relation due to changes in channel and tidal conditions which may have taken place or will occur in the future. Also, during periods of low stream flow, the continuation of salinity sampling has been essential in keeping the Delta irrigators advised of conditions through periodic bulletins so that damage from the use of water of too high salt content might be averted. (Saline concentrations exceeding 100 parts of chlorine per 100,000 parts

of water are toxic to the average plant and are objectionable for human consumption.)

During 1950 the continuous observations of salinity served as an important factor in determining the amounts of release from Shasta Reservoir as controlled by the U. S. Bureau of Reclamation.

Scope

The general scope of this investigation each season has been such as to insure that samples of water to be tested for salinity could be taken at regular intervals at a sufficient number of stations throughout the Delta and upper Bay region so that the advance and retreat of the salinity from early summer to late fall would be completely recorded. Plate 4 shows the limit of encroachment into the Delta of water having 100 parts of chlorine per 100,000 parts of water for the years 1931, 1938, 1943, 1944, 1945, 1946, 1947, 1948, 1949 and 1950. These certain years are chosen, first, to represent a range of runoff conditions prior to the commencement of releases from Shasta Reservoir, to wit, 30 percent of normal runoff during 1931, 170 percent of normal runoff during 1938, 114 percent of normal runoff during 1943, and second, to represent the consecutive years concurrent with those releases. The salinity encroachment lines for each of the years 1920 to 1944, inclusive, may be found on the Delta map in the 1944 annual Water Supervision report.

Due to curtailment of appropriations to the Division of Water Resources by the Legislature in the 1941-1942 budget, sampling for salinity at all stations in the Bay and Delta areas was stopped by the Division of Water Resources on July 15, 1941. Through cooperation of the Fontana Farms Company, the City of Antioch Water Department, the U. S. Bureau of Reclamation, the Dow Chemical Company at Pittsburg and the City of San Francisco, miscellaneous samples were taken during the 1943 season and the results of the analyses are presented in the 1943 report of Water Supervision. In that same report there are tabulated a large number of complete analyses of water from the channels of the Sacramento and San Joaquin valleys and the Delta as prepared by the U. S. Bureau of Reclamation.

A regular program of salinity sampling and testing was re-established early in 1944 as part of the activities of the Sacramento-San Joaquin Water Supervision, with the necessary funds therefor being provided by the U. S. Bureau of Reclamation. This regular program was continued throughout 1950. The records of water samples taken during 1950 from 35 active sampling stations are given in Table 195. A description of the location of each of these stations is contained in Table 194.

Complete or Partial Analyses of Surface Flows

As a matter of record there is included in this report a tabulation of the results of complete or partial chemical analyses of samples of water taken at many points along the Sacramento and San Joaquin rivers and in the Delta during 1950. These results are contained in Table 197 and are furnished entirely by the U. S. Bureau of Reclamation. The methods of collecting the samples and of analysis are definitely different from the

methods employed in determining the chlorine component as part of the regular salinity observation activities in the Sacramento-San Joaquin Delta.

Sacramento River Water Moves Southward

With reference to Table 195, a study of the salinity concentrations in progressive months points out clearly that the freshening effect of Sacramento River water reaches far southward into the branching channels of the San Joaquin River. This condition may be expected when consideration is given to the relatively small amounts of inflow from the San Joaquin River. The more than 100,000 acres of upland and delta lands lying south of the latitude of Stockton require irrigation flows in excess of 1,000 second-feet during months of maximum use. During the months March through June in 1949, the inflows to this southern Delta area from the San Joaquin River were sufficient to meet this demand, and in consequence created a state of stagnation in the vicinity of Stockton. However, during the months of July, August and September, when the average inflow from the San Joaquin River dropped to approximately 600 second-feet, the point of stagnation in the main San Joaquin River channel moved southward, resulting in an upstream flow past Stockton of water derived from the Sacramento River with an estimated maximum daily flow of approximately 400 second-feet. Concurrent with this latter condition Sacramento River water transfused southward into the San Joaquin River portion of the Delta through Old River, Middle River and Whiskey Slough.

Station Maintenance and Records

The salinity sampling at all stations is done by local observers. Each observer is provided with a schedule showing the exact time for taking the samples, so that, throughout the Delta and upper bays all samples are taken at approximately one and one-half hours after the same high tide at four-day intervals. Table 194 gives the location and description of each active station from which samples were received during 1950. Location description of inactive stations are deleted in this report but can be found in previous reports.

The observers are furnished with stamped containers for the sample bottles so that the latter can be mailed, as filled, to the laboratory at Sacramento. All analyses of the water were made at the Materials and Research Laboratory of the Division of Highways in Sacramento during the 1950 season.

The maximum salinity as recorded at the stations in 1950 is shown in Table 193. For comparative pruposes, this table shows also the maximum salinity recorded at these stations in representative years before and after Shasta Reservoir operation. Only presently indicative and active stations are included in this comparison.

Salinity Bulletins

During 1950 a salinity bulletin was mailed each month to many cooperating agencies and individuals giving the results of samples taken and analyzed at four-day intervals at all stations. The figures given were the laboratory determination of the number of parts

of chlorine per 100,000 parts of water.

Area of Salinity Encroachment

There is an apparent relation between the average stream flow to the Delta during the ten-day period of minimum flow and the area affected by salinity encroachment. Data amassed in this regard indicate that when the flow to the Delta drops below a certain amount the rate of advance of salinity encroachment greatly accelerates. A comparison of the average stream flows during the ten-day period of minimum flow and the affected acreage in the Delta is presented in Table 196. The area affected by salinity encroachment of 100 parts of chlorine per 100,000 parts of water amounted to approximately 5,000 acres in 1950.

TIDE GAGES

The 28 recording tide gages located on the Delta channels and on the upper bays were continued during 1950. Previous Water Supervision reports contained detailed descriptions and locations of the gages. The Flood Control branch of the Division of Water Resources operates and maintains 18 of these tide gages. The remaining 10 are operated by Federal agencies.

NR No record.
a Not included in inventory or totals.
a Flow of Cottonwood Creek has been omitted and diversions between the dam and Friant gaging station have been added to the computed inflow to Friant Reservoir as received from the U. S. Bureau of Reclamation.
b Figures from U. S. Bureau of Reclamation giving the flow at Mile 8.8 below the head of Madera Canal.
c Includes diversions from Fresno Slough.
d Includes diversions from Merced River below Stevinson.
e Includes diversions from Tuolumne River below Tuolumne City.
f Flow at Hetch Hetchy Crossing was computed for the periods, January 1 to June 30, and November 21 to December 31, by addition of the flow at Maze Road and the diversions between Hetch Hetchy Crossing and Maze Road.
g Includes diversions from Stanislaus River below Mile 4.3.
h Includes diversions from Dry Creek below Modesto.

This is the total mean second-feet flow inflowing to Shasta Reservoir as computed by the U. S. Bureau of Reclamation, taking into account change in storage, release, spill and evaporation; and represents the natural flow passing the dam site if the dam had not been constructed. Drainage area is 6665 square miles.

Station is maintained jointly by the Division of Water Resources and the U. S. Geological Survey. It is located at Mile 19.6 above Sacramento at the mouth of "Cross Canal", main drain between Reclamation Districts 1000 and 1001, and below the mouth of the Feather River. Flows are measured below the mouth of Cross Canal. Drainage area is 21400 square miles. Period of record 1926 to date. Records for 1950 computed by U. S. Geological Survey.

Division of Water Resources station located at Mile 0.4 above M Street Bridge. This represents the flow of the Sacramento River past Sacramento (below the City of Sacramento intake) to the Delta. Additional water flows to the Delta via East Borrow Pit of Yolo By-Pass. (See Tables 75 and 84) Daily mean flows are computed from newly derived curves which take into account tidal fluctuations during low stages. Period of record 1904, 1905, 1921, 1924 to date.
e Estimated.

U. S. Geological Survey and Division of Water Resources cooperative station located 9 miles northeast of Vina and 0.8 mile upstream from a diversion dam. Deer Creek is an east-side tributary to the Sacramento River at Mile 168.5L. Drainage area is 200 square miles. Period of record 1911 to 1915; 1920 to 1937; 1939 to date. Records for 1950 computed by U. S. Geological Survey.

U. S. Geological Survey and U. S. Army Corps of Engineers cooperative station located about 5 miles above the mouth and above the Glenn-Colusa Irrigation District canal crossing. The flow to the Sacramento River is cut off during irrigation season by an earth fill installed by Glenn-Colusa Irrigation District to transport water from their main canal across Stony Creek. Stony Creek is a west-side tributary to the Sacramento River at Mile 136.3R. Water diverted from Stony Creek by G.C.I.D. in acre-feet amounted to: April 8300, May 791, October 69, November 341. Drainage area is 761 square miles. Period of record 1941 to date. Records for 1950 computed by U. S. Geological Survey.

U. S. Geological Survey and Division of Water Resources cooperative station located 0.8 mile downstream from Little Butte Creek and 7.5 miles east of Chico. Butte Creek is a tributary to the Sacramento River, via Butte Slough, at Mile 84.0L. (See notes on Tables 41 and 52. Drainage area of Butte Creek near Chico is 148 square miles and period of record 1930 to date. Records for 1950 computed by U. S. Geological Survey.

This is the discharge to the Sacramento River at Mile 84.0L and is measured at and regulated by the gravity culverts at the mouth of the slough. These flows, together with those shown in Tables 52 and 53 are, during the summer months, made up almost entirely of return water from lands irrigated by Feather River diversions. Discharge from the Sacramento to Butte Basin over Moulton and Colusa weirs is shown in Tables 39 and 40. This is a Division of Water Resources station. Period of record 1924 to date.
e Estimated.

This is the drainage from Reclamation District 70 returned to the Sacramento River at Mile 68.8L. This is a combination irrigation and drainage plant and discharges both to the Sacramento River and to an irrigation canal. The above flow includes gravity as well as pumped drainage. Period of record 1924 to date. Records for 1950 computed by Division of Water Resources.

Division of Water Resources station located 37.0 miles above the mouth of Back Borrow Pit of Reclamation District 108. This is return wa er flowing in the main drain of Reclamation District 2047; it is drainage chiefly from lands irrigated by Glenn-Colusa, Provident, Princeton-Codora-Glenn, Compton-Delevan, Maxwell and Jacinto Irrigation Districts. Flow reaches Sacramento River, at Mile 34.15R, through the Knights Landing outfall gates via Back Borrow Pit, (See Table 49). Period of record 1924 to date.

* Also known as Colusa Trough at Highway 20 and Colusa Trough at Tahoe-Ukiah Highway.

e Estimated.

Knights Landing Ridge Cut diverts water from the Back Borrow Pit of Reclamation District 108 at a point above the outfall gates, into the Yolo By-Pass above Elkhorn. Winter flows are uncontrolled. Summer flows for irrigation are controlled at the outfall gates and at the junction with Yolo By-Pass by weir boards and gates. This is a Division of Water Resources station. Period of record 1933 to date.
e Estimated.

This is the drainage from Colusa Basin passing down the Back Borrow Pit of Reclamation Districts 108 and 787 and entering the Sacramento River at Mile 34.15R, just above the Knights Landing gaging station. Flows are controlled at the Knights Landing outfall gates and a portion of the flow of the Back Borrow Pit is diverted to the Knights Landing Ridge Cut. This diversion is shown in Table 48. Total flow to Sacramento River is sum of Tables 49 and 50. This is a Division of Water Resources station. Period of record 1924 to date.
e Estimated.

This water is discharged from Reclamation District 787 by pumping into Colusa Basin Drain below the outfall gates and is not included in the flow shown in Table 49. Daily distribution of flows are not available since the plant operates on an automatic float switch. A small amount of additional drainage by gravity is not included in the above flows. See Table 45 for additional drainage from Reclamation District 787. Period of record 1940 to date. Records for 1950 computed by Division of Water Resources.

This is discharge from Butte Slough to Sutter By-Pass. During low flow periods gates at head of slough are regulated (Table 41) which forces water under Long Bridge as shown in this table. Normal summer flows are primarily from Feather River sources. During flood periods Sacramento River water enters Butte Basin above Butte City by bank spill and over Moulton and Colusa weirs. The purpose of the summer regulation is to make water available for use on Sutter By-Pass lands (below Long Bridge) and Butte Slough Irrigation Company in R. D. 70. This is a Division of Water Resources station. Period of record 1939 to date.

This is the discharge (measured at Weir #4) to the East Borrow Pit of the Sutter By-Pass at Mile 16.0 (north from Chandler). This flow is made up primarily of Feather River drainage or return flows. This flow and flow from Butte Slough (Table 52) makes up the entire Feather River contribution to the Sutter By-Pass. This is a Division of Water Resources station. Period of record 1939 to date.
e Estimated.

This is the drainage from Reclamation District 1500 discharged to West Borrow Pit of Sutter By-Pass and thence via Sacramento Slough (in the By-Pass) to Sacramento River, (See Table 55). Drainage is by pumping and gravity. Period of record 1930 to date. Records for 1950 computed by Division of Water Resources.

This is the discharge to the Sacramento River at Mile 21.2L via Sacramento Slough. This is the entire outflow of the Sutter By-Pass area and R. D. 1500. During high water periods the slough is entirely submerged as it lies within the By-Pass area. Sharp rises in river elevation will cause zero or negative flow. See Tables 52, 53, 54 and 43, which, when combined, will give the measured flow entering the By-Pass area. This is a Division of Water Resources station. Period of record 1924 to date.

* By-Pass flooded - flow not confined to slough channel.

Station is maintained jointly by the Division of Water Resources and the U. S. Geological Survey. It is located on the right bank of the Feather River just below the mouth of the Yuba River at Mile 27.0R. Station was installed December 6, 1949. Station is rated at high stages by simultaneously measuring the flows of the Feather River at 5th Street Bridge and the Yuba River at Simpson Lane Bridge. Period of record 1949 to date. Records for 1950 computed by Division of Water Resources.

Division of Water Resources station located on the right bank at Mile 23.0 above mouth. Station is rated above 25000 c.f.s. by means of simultaneous measurements of Yuba River and Feather River at Marysville with appropriate time lag between Marysville and Shanghai Bend. Period of record 1944 to date.

U. S. Geological Survey and Division of Water Resources station located approximately 2.5 miles southeast of Bangor and 16 miles above the mouth. Honcut Creek is an east-side tributary to the Feather River at Mile 43.7L. Drainage area is 68.6 square miles. Prior records available at a site 8 miles downstream. Records for 1950 computed by the U. S. Geological Survey.
* Beginning of record.

Division of Water Resources station located 6 miles east of Verona on R.D. 1000 Drainage Canal at Fifield Road. Pleasant Grove Creek is an east-side tributary to the Sacramento River at Mile 19.6L, via "Cross Canal", the main drain between Reclamation District 1000 and 1001. Recorder installed January 10, removed April 17, reinstalled November 17. Period of record 1950.
e Estimated.

This is drainage from Reclamation District 1000 returned to Sacramento River by pumping and gravity at Mile 6.85L. Daily distribution of flows are not available since the plant operates automatically on float switch. Additional water returned to Sacramento River from same district at Mile 2.1L, (See Table 76). Water returned to the Sacramento River from the Pritchard Lake Plant at Mile 16.0L was negligible during 1950. Period of record 1940 to date. Records for 1950 computed by Division of Water Resources.

Station is maintained jointly by Division of Water Resources and the U. S. Geological Survey. Station is located at the "H" Street Bridge and is 6.0 miles above mouth of river. The American River flows into the Sacramento River at Mile 1.1L. Period of record 1921, 1926 to date. Record for 1950 computed by U. S. Geological Survey.

* An unmeasured amount of water by-passed the gaging station on the right bank November 19, 20, 21, 22 and December 3, 4, 7, and 8. The maximum unmeasured flow was estimated as 70,000 second-feet on November 21.

Station is maintained jointly by the Division of Water Resources and the U. S. Geological Survey. The flow of this station is referred to the recorder at the end of the Sacramento By-Pass except during periods of high water when it is referred to the recorder at the Woodland-Elkhorn highway crossing. To get total flow through Yolo By-Pass below Sacramento, combine this flow with the flow in Tables 75 and 83. The flow in this table includes the flows of Cache Creek (Table 81), Knights Landing Ridge Cut (Table 48), and Fremont Weir (Table 51). Period of record 1930 to date. Records for 1950 computed by U. S. Geological Survey.

* Also known as Yolo By-Pass at Elkhorn.

U. S. Geological Survey, U. S. Bureau of Reclamation and Division of Water Resources cooperative station located on Highway 99 bridge. When flow in main channel reaches 4600 c.f.s. water starts to by-pass station. Figures here given include all overflow. Drainage area is 730 square miles. Period of record 1942 to date. Records for 1950 computed by U. S. Geological Survey.

Division of Water Resources station located 1.5 miles southeast of French Camp at Sharps Lane Bridge. French Camp Slough is an east-side tributary to the San Joaquin River at Mile 46.1R. For the period May 22 through November 18, the stream was not rated because of a variable backwater condition created by an earth fill dam which was constructed downstream from the recorder.
* Sometimes referred to as Littlejohns Creek near French Camp.
** Beginning of record.
e Estimated.

This is the total mean second-feet flow inflowing to Friant Reservoir as computed by the U. S. Bureau of Reclamation, taking into account change in storage, release, spill and evaporation; and represents the natural flow passing the dam site if the dam had not been constructed. Flows shown also include Cottonwood Creek (Table 114). Drainage area is 1671 square miles.

Annual Gain or Loss in Storage: Calendar Year +326,900 Acre-Feet; Water Year +1,900 Acre-Feet.
Difference in Storage 1949 to 1950; Maximums -9,500 Acre-Feet; Minimums +25,100 Acre-Feet.

Reservoir water level recorder maintained by U. S. Bureau of Reclamation and U. S. Geological Survey. Period of record 1941 to date. Records for 1950 computed by U. S. Bureau of Reclamation.

U. S. Geological Survey station located at Mile 268.13L and 1.5 miles downstream from Cottonwood Creek. Daily mean release from Friant Reservoir into San Joaquin River is obtainable from this table by subtracting flows of Cottonwood Creek (Table 114). Drainage area is 1675 square miles. Period of record 1938 to date. (Prior records available at sites 2.5 and 4.5 miles upstream.) Records for 1950 computed by U. S. Geological Survey.

U. S. Geological Survey, U. S. Bureau of Reclamation and Division of Water Resources cooperative station located at highway bridge on road between Gustine and Stevinson, Mile 129.5 above mouth of San Joaquin River and 5.7 miles above the confluence of the Merced River. An undetermined amount of water during high flow periods of November and December passed this station via Mud Slough. Drainage area is 8090 square miles. Period of record 1937 to date. Records for 1950 computed by U. S. Geological Survey.

Station is maintained jointly by the Division of Water Resources and the U. S. Geological Survey. It is located at Hills Ferry bridge, Mile 123.7 above mouth of San Joaquin River and just below the mouth of the Merced River. Combine flow with Merced River Slough (Table 124) to give total flow passing this point. Drainage area is 9990 square miles. Period of record 1912 to date. Records for 1950 computed by U. S. Geological Survey.

Station is maintained jointly by City of San Francisco (Hetch Hetchy Water Supply), Division of Water Resources, Modesto Irrigation District and Turlock Irrigation District. Station is at Laird Slough Bridge, Mile 96.05 above mouth of San Joaquin River and 5 miles above the confluence of the Tuolumne River. High flows by-passing this station through old channel of San Joaquin River are included in this table. Period of record 1931 to date. Records for 1950 computed by the City of San Francisco.

Station is maintained jointly by City of San Francisco (Hetch Hetchy Water Supply) and Division of Water Resources. Station is at Mile 82.65 above mouth of San Joaquin River and 2.9 miles above the confluence of the Stanislaus River. Period of record 1936 to date. Records for 1950 computed by the City of San Francisco.
* Maze Road (January 1 - June 30) and (November 21 - December 31).

U. S. Geological Survey and U. S. Bureau of Reclamation cooperative station located a short distance below the station presently operated by the King's River Water Association. Station is located below Kerman-San Joaquin highway crossing on Fresno Slough By-Pass 5.8 miles above its confluence with Fresno Slough. Fresno Slough By-Pass enters Fresno Slough at Mile 11.8R above mouth of Fresno Slough. Period of record 1927 to 1932; 1935 to date. Records for 1950 computed by U. S. Geological Survey.
* Also known as James By-Pass and Fresno Slough Cut-off.

U. S. Geological Survey, U. S. Bureau of Reclamation and Division of Water Resources cooperative station located 500 feet downstream from the head of the slough between Merced River and San Joaquin River. This station records the flow which at high stages in the Merced River by-passes the Hills Ferry Road bridge and reaches the San Joaquin River at Mile 122.2 at a point below the Newman gaging station. Period of record 1941 to date. Records for 1950 computed by the U. S. Geological Survey.
* Also known as Merced River Slough near Hills Ferry Road Bridge.

Division of Water Resources and U. S. Bureau of Reclamation cooperative station located just above the Corcoran-Angiola Highway bridge, 39.0 miles downstream from the junction of South Fork. This station measures inflow to Tulare Lake area and at times the flows are a combination of direct Tule River water, Kaweah River water via Elk Bayou (See Table 146), and Kings River water via Homeland Canal, and waste water from Tulare Irrigation District. Period of record 1942 to date. Records for 1950 computed by Division of Water Resources.

(a) Additional acre-feet diverted: January 1996, February 1852, November 2177 and December 2118.
(b) An undetermined amount of water received from wells.
(c) Formerly listed as A. M. Harbinson.
(d) An undetermined amount of water received from controlled drainage.
(e) Combined acreage this plant and one at Mile 8.3R.
(f) Additional acre-feet diverted: November 1.
(g) See plant at Mile 7.9R.
(h) The 8" unit installed in 1950.
(i) The 14" unit did not operate in 1950.
(j) Formerly listed as John Schachtilli.
(k) Includes 1265 acres outside Conway Ranch.
(l) Formerly listed as Gertrude Brown.
(m) An additional 414 acre-feet diverted in April by gravity through Elkhorn #3 drain plant at Mile 6.85L and then re-diverted to Elkhorn Mutual Water Company lands.

* Cross Canal - The main drain between R.D.1000 and 1001 joins the Sacramento River at Mile 19.6L. Distance from Sacramento River and the bank is shown in ().
(a) Listed as 2-28" units in 1949.
(b) An additional 793 acres irrigated from controlled drainage.
(c) Formerly listed as Mile 16.2R.
(d) Formerly listed as Mile *(0.5S).
(e) An undetermined amount of water received from controlled drainage.
(f) Also receives water from plant on Yolo By-Pass at Mile 10.0N and plant on Knights Landing Ridge Cut at Mile 6.3R.
(g) New installation in 1950.
(h) Combined acreage for this plant and one at Mile 31.75R.
(i) 10" unit removed in 1950.
(j) See plant at Mile 29.7R.

(a) Includes 40 acres of Rohleter lands.
(b) Operated 20" unit only in 1950.
(c) Formerly listed as E. B. Vann.
(d) 10" unit removed 1950.
(e) Furnished an undetermined amount of water to plant at Mile 76.15L.
(f) Includes 50 acres of Coffman and Moore lands.
(g) Received an undetermined amount of water from pump at Mile 76.1L.
(h) Includes 19 acres on Albertson lands.
(i) Formerly listed as Hankins Brothers.
(j) Operated 12" units only in 1950.
(k) Combined acreage this plant and one on Back Borrow Pit at Mile 31.5L.
(l) Includes 104 acres of Goddnow, Rockholt, Stass and Lemos lands.
(m) Additional acre-feet diverted: November 11.
(n) Includes 64 acres of Burtis lands and 52 acres of Wood lands.
(o) Includes 1063 acres irrigated from controlled drainage.
(p) Additional acre-feet diverted: February 1.
(q) Additional acre-feet diverted: January 14 for sheep.
(r) Includes 35 acres of Pearl Clark lands.
(s) Additional acre-feet diverted: November 18.
(t) Combined acreage this plant and one at Mile 87.4R.
(u) See plant at Mile 86.9R.
(v) Includes 2 acres of Locovitch lands.

(a) Replaced 16" unit formerly listed at this location.
(b) Combined acreage this plant and plants on Butte Creek at Miles 11.8R and 14.4R.
(c) Includes 772 acres of duck club lands of which 567 is re-used rice lands. Includes 330 acres rice and 75 acre general crop lands outside district. Combine acreage for this plant and one at Mile 123.9R. Received an undetermined amount of water on 99 acres general crops from Glenn-Colusa I.D. plant at Mile 154.8R.
(d) Replaced 10" unit formerly listed at this location.
(e) Additional acre-feet diverted: February 8.
(f) Formerly listed as R.H. Gebicke.
(g) Installed prior to 1950, not previously listed.
(h) Additional acre-feet diverted: November 2.
(i) See plant at Mile 112.4R.
(j) Replaced two of the 42" units formerly listed at this location.
(k) No operation of 42" units in 1950.
(l) Additional acre-feet diverted: January 1905 and November 485.
(m) Furnished an undetermined amount of water to 860 acres of Glenn Colusa I.D. lands.
(n) Combined acreage this plant and one on Sacramento River at Mile 154.8R and plants on Colusa Trough at Miles 20.5R, 24.2R, 27.2R and Opp. 27.2R. Includes the following acreage that received an undetermined amount of water from Glenn Colusa I.D. plant on Sacramento River at Mile 154.8R; Rice 249, Clover 268 and Flooded lands 89. Includes 5000 acres duck club lands listed in general crops.
(o) New installation 1950.
(p) Additional acre-feet diverted; November 25.
(q) One 6" unit moved from Mile 133.4L to this location.
(r) Combined acreage this plant and one at Mile 133.5L.
(s) See plant at Mile 133.45L.
(t) Acreage segregated as follows: M. & T.Inc.,876 rice and 1312 general crops; Parrott Investment Co.,1600 rice and 1268 general crops.
(u) Formerly listed as Alameda Putney.
(v) Formerly listed as Lloyd & D.A. Hazelton.
(w) Additional acre-feet diverted: January 9 and November 2.
(x) Combined acreage this plant and one at Mile 150.0L.
(y) See plant at Mile 149.7L.

* This is a common point of diversion for Glenn-Colusa, Compton-Delevan, Provident, Princeton-Codora-Glenn and Maxwell I.D. See Glenn-Colusa I.D. plant at Mile 154.8R.
(a) An undetermined amount of water received from wells.
(b) Installation in 1950 at old point of diversion.
(c) An undetermined amount of water exchanged between this plant and Glenn-Colusa I.D. plant at Mile 154.8R.
(d) New 54" unit installed in 1950.
(e) Additional acre-feet diverted: November 11841. Diverted by gravity from Stony Creek in acre-feet: April 8300, May 791, October 69 and November 341. Furnished an undetermined amount of water to 99 acres general crops on lands of the Princeton-Codora-Glenn I.D. and 606 acres on lands of Provident I.D.
(f) An undetermined amount of water exchanged between this plant and Jacinto I.D. plant on Sacramento River at Mile 154.75R. Furnished an undetermined amount of water to plant on Back Borrow Pit at Mile 26.4R.
(g) Includes the following acreages outside the district: Rice 710, duck clubs 450, Sudan 165, Alfalfa 45 and Clover 15. Includes 860 acres which received an undetermined amount of water from Provident I.D. plants on Sacramento River at Mile 124.2R.
(h) See plant at Mile 124.2R.
(i) An undetermined amount of water received from controlled drainage.
(j) Formerly listed as an 8" unit.
(k) Installed in 1949, not previously listed.
(l) Previously listed as 12" unit.
(m) Formerly listed as G.C. Kelber.
(n) Formerly listed as Coneland Water Company.
(o) New installation in 1950.
(p) Additional acre-feet diverted: November 2.
(q) All gun club lands.

* Main Drain of Reclamation District #2047.
** Mileage along Colusa Trough above Colusa-Williams Highway.
(a) 130 acres re-used for duck club lands.
(b) Includes 300 acres of Fletcher lands and 110 acres of Bower lands.
(c) Additional water diverted: January 6, November 7 and December 2.
(d) Additional acre-feet diverted: November 41.
(e) New installation 1950.
(f) An undetermined amount of water received from wells.
(g) Additional acre-feet diverted: January 18 and November 145.
(h) All duck club lands.
(i) Formerly listed as 2-20" units.
(j) Formerly listed as 11.7L.
(k) See plant on Sacramento River Mile 103.7R.
(l) Formerly listed as 11.7R.
(m) Additional acre-feet diverted: November 363.
(n) Installed 1949, not previously listed.
(o) Additional acre-feet diverted: December 195.
(p) Formerly listed as R.T. and W. Dillard and Mr. Helpstine.
(q) Additional acre-feet diverted: December 70.
(r) An undetermined amount of water received from Princeton Codora Glenn Irrigation District.
(s) Plant is on Willow Creek S.W. corner Section 33 T. 19 N R 2 W.
(t) Listed as 26" unit in 1949 report.
(u) See plant, Sacramento River, Mile 124.2R.
(v) Works on Drain #55 and are in SW¼ NW¼ Section 86, Glenn Ranch Survey.
(w) Additional acre-feet diverted: November 1100 and December 600.
(x) Installed prior to 1950, not previously listed.
(y) Works on Drain #13 and are in SW¼ SW¼ Section 51, Glenn Ranch Survey.
(z) Additional acre-feet diverted: November 33, and by gravity November 700 and December 500.

* Carries return water from Colusa Basin along west border of Reclamation Districts 108 and 787 and thence to discharge to Sacramento River at Knights Landing or partial diversion via Knights Landing Ridge Cut.

** Mileage along Borrow Pit from Outfall Gates just above junction of Borrow Pit with Sacramento River at Knights Landing.

(a) New installation 1950.
(b) See plant Sacramento River Mile 34.5R.
(c) Operated one 16" unit only in 1950.
(d) Formerly listed as Earl L. Wallace and Cecil Hulse.
(e) An undetermined amount of water received from wells.
(f) Includes 75 acres of Taylor lands.
(g) Includes 40 acres of Hermle lands, 40 acres of Hershey lands and 120 acres of Morris lands.
(h) Additional acre-feet diverted: January 23.
(i) Operated 20" unit only in 1950.
(j) See plant Sacramento River, Mile 63.2R.
(k) Formerly listed as Gregory Estate.
(l) Replaces 15" unit formerly listed at this location.
(m) Includes 93 acres of George Knox Estate lands.
(n) Formerly listed as Herman Kalfsbeek.
(o) Includes 80 acres of Olin lands and 60 acres of Dorbrosky lands.
(p) Additional acre-feet diverted: January 16 and November 31.
(q) Formerly listed as Fred Kleeman.
(r) Includes 107 acres of Greive lands and 53 acres of Christian lands.
(s) An undetermined amount of water received from wells and from Glenn Colusa Irrigation District Plant on Sacramento River at Mile 154.8R.
(t) Operated 16" unit only in 1950.

* Approximate mileage from junction with Sacramento River.
(a) Removed one 36" unit in 1950.
(b) Operated 24" only in 1950.
(c) See plant Sacramento River, Mile 89.25L.
(d) Formerly listed as 8.2L.
(e) This unit added in 1950.
(f) Additional acre-feet diverted: November 3500 & December 3500.
(g) All Gun Club lands.
(h) Partially estimated from previous years.
(i) Additional acre-feet diverted: November 600 and December 600.
(j) See plant Sacramento River, Mile 112.1L.
(k) Additional acre-feet diverted: November 30.
(l) Includes 50 acres of gun club lands.
(m) Re-used for gun clubs.
(n) Formerly listed as 14.4L.
(o) Additional acre-feet diverted: December 49.
(p) Formerly listed as H.W. McGowan.
(q) 16" unit removed in 1950.
(r) Formerly listed as A.H. Hulen.
(s) Formerly listed as McGowan Ranch.
(t) One 16" unit removed in 1950.
(u) Flow in Butte Slough, derived from Butte Creek, is controlled by Outfall Gates at its junction with Sacramento River and is thereby retained in Butte Slough to discharge into East and West Borrow Pits of Sutter By-Pass near "Long Bridge". The Outfall Gates are maintained by the Division of Water Resources and are cooperatively operated with the Butte Slough Irrigation Company. See Sutter By-Pass Diversions, Table 159.
(v) See acreages under rediversion--West Borrow Pit Sutter By-Pass. A considerable additional but undetermined amount of acreage was served by subirrigation and direct diversions from flow diverted to East Borrow Pit of Sutter By-Pass which is joined by Feather River return flow entering via Wadsworth Canal, Table
(w) Combined acreage for plants at this mile and Mile 1.4E.
(x) Includes 7 acres on Browning lands.
(y) See plant at Mile .9E.
(z) Combined acreage for plants at this mile and Mile 4.1W.
(aa) Includes 74 acres on C.P. Reische lands.
(bb) Formerly listed as Granniman and Feiths.
(cc) See plant at Mile 3.7W.
(dd) Formerly listed as E.V. Jacobs Estate.
(ee) Formerly listed as P.B. Hensen and Hankins.
(ff) Includes 25 acres on Jacob Lovovitch lands.

* Asterisk indicates area irrigated is within By-Pass area.
(a) Mileages of West Borrow Pit are given northerly from drainage plant of Reclamation District 1500. Mile 9.15 West Borrow Pit is opposite Chandler.
(b) Listed as Mile 8.5R in 1949.
(c) Formerly listed as G. Guisti.
(d) Includes 17 acres of Ugo Serieri lands, also 697 acres flooded after cropped for cover crop.
(e) Combined acreage for plants at this mile and Mile 28.4R.
(f) See plant at Mile 25.0R.
(g) New Installation 1950.
(h) Mileage of East Borrow Pit are given northerly or southerly from Chandler.
(i) Listed as 0.9S in 1949 report.
(j) Plant is on drain canal that joins East Borrow Pit at Mile 1.4N. Figure in () indicates miles along drain from By-Pass.
(k) Combine acreage this plant and one at Mile 4.0N.
(l) See plant at Mile 2.9N.
(m) Includes 160 acres of Ham and Johnson lands.
(n) Formerly listed as R.E. Hughes #2.
(o) Replaces 6" unit formerly listed at this location.
(p) Formerly listed as Martin Gun Club.
(q) Additional acre-feet diverted: November 33.
(r) All Gun Club lands.
(s) Plant is on main drain of Plant #2 of East Borrow Pit-Sutter By-Pass that joins East Borrow Pit at Mile 10.0N. Figure in () is distance along drain from East Borrow Pit.
(t) Installed 1949, not previously listed.
(u) Installed prior to 1950, not previously listed.
(v) Operated 16" unit only in 1950.

(b) Formerly listed as Mrs. E.P. Reddington.
(c) Combined acreage plants at this mile and Mile 12.0N.
(d) Replaces 12" unit formerly listed at this location.
(e) See plant at Mile 11.5N.
(f) All duck refuge lands.
(g) Plant is on Wadsworth Canal which joins East Borrow Pit-Sutter By-Pass at Mile 16.5N. Figure in () is distance along Wadsworth Canal from By-Pass.
(h) New Installation in 1950.
(i) Furnished an undetermined amount of water to plant at Mile (g)(1.36R).
(j) Received an undetermined amount of water from plant at Mile 16.5N (1.35R). Also received an undetermined amount of water from wells.
(k) Includes 17 acres of Kellogg lands and 80 acres of Stohlman lands.
(l) Acreage partially estimated.
(m) Formerly listed as C.C. Epperson et al.
(n) One 10" unit installed in 1950.
(o) Replaces 10" unit formerly listed at this location.
(p) Additional acre-feet diverted: November 1.
(q) Formerly listed as a 10" unit.
(r) Plant is on Poodle Creek which joins By-Pass at Mile 16.5N. Figure in () indicates distance along Poodle Creek from By-Pass.
(s) Formerly listed as Mrs. H.C. and C.H. Epperson.
(t) Combined acreage this plant and plants at Mile (r)(1.5) H.C. and C.H. Epperson and Mile (r)(1.6).
(u) See plant at Mile (r)(1.5) Phillip Niesen.
(v) Formerly listed as D.Meyers, et al.
(w) Additional acre-feet diverted: November 49.
(x) Formerly listed as Meyer, Platter, Moorehead, DeWitt Bros., Middleton and Epperson.
(y) Mileages of Sacramento Slough are given easterly from drainage plant of Reclamation District 1500 which is at head of Slough.

* Honcut Slough - Plant diverts Feather River water backed into Slough. Mouth of Slough at Mile 43.7L. Distance from Feather River and bank is shown in ().

(a) Additional acre-feet diverted: February 3 and November 1.
(b) An undetermined amount of water received from controlled drainage.
(c) Formerly listed as one 24" unit.
(d) An undetermined amount of water received from wells.
(e) Formerly listed as Hamilton, Broberg and Stuart.
(f) New installation in 1950.
(g) Formerly listed as Sutter Butte Canal Company (Sunset Plant).
(h) Operated 2-42" units only in 1950.
(i) An undetermined amount of water received from plant at Mile 58.1R.
(j) Formerly listed as Mat. Thomes.
(k) The 20" unit installed in 1950.
(l) Combined acreage this plant and one at Mile 47.9L.
(m) See plant at Mile 47.4L.
(n) Installed prior to 1950, not previously listed.
(o) Combined acreage this plant and plant at Mile 48.3L.
(p) See plant at Mile 48.0L.
(q) Additional acre-feet diverted: November 1.
(r) Formerly listed as Tony Bettencourt.
(s) Formerly listed as Capital Company.
(t) Formerly listed as J. F. Fratus.
(u) Formerly listed as Hearst Estate.

(a) Formerly listed as Henry Hazelbusch.
(b) This is a common point of diversion for Sutter-Butte Canal Company, Richvale Irrigation District and Biggs-West Gridley water districts. Diversions are reported separately.
(c) There is included in these totals 23909 acre-feet purchased from P.G.& E. Company, however, no segregation was made between districts or companies in this table.
(d) Furnished an undetermined amount of water to plant at Mile 38.1R.
(e) An undetermined amount of water received from controlled drainage.
(f) Additional acre-feet diverted: January 2529, used for gun club. Includes 5367 acre-feet in October for gun club.

* Distance from mouth of San Joaquin River 4½ miles below Antioch (mileage as established by War Department Survey of 1913-15).

(a) This is the point of diversion of the U.S. Bureau of Reclamation Contra Costa Canal at head of Rock Slough.

(b) Additional acre-feet diverted: January 1884, February 886, November 2038 and December 1247.

(c) In addition to this acreage, also served Industrial and Municipality.

(d) Formerly listed as Mile 36.4L.

(e) Indian Slough joins the Old River at this mile. Pumping plant is located on intake canal which joins Indian Slough.

(f) Additional acre-feet diverted: December 20.

(g) Additional water received from wells-3732 acre-feet.

(h) Italian Slough joins the Old River at this mile. Pumping plant is located on intake canal which joins Italian Slough.

(i) Additional acre-feet diverted: November 131.

(j) Pumping plant is located on intake canal which joins Old River at this mile.

(k) Of this figure 942 acres were double cropped.

(l) Plant moved to this location in 1950 from Mile 48.7L.

(m) New installation in 1950.

(n) Replaces 8" unit previously listed at this location.

* Distance along San Joaquin River from its mouth 4½ miles below Antioch. (Mileage as established by War Department Survey 1913-15).
** Pertinent data furnished by U.S.B.R.
*** Plant is located on East Side Canal which leaves the San Joaquin River at Mile 163.6R. Distance from the river along East Side Canal is shown in ().
(a) Point of diversion is at head of Temple Slough.
(b) Diversion contracts with U.S.B.R. are limited to one year periods.
(c) An undetermined amount of water received from wells.
(d) The 4" unit replaced 3" unit in 1950.
(e) Includes Main Canal, Helm Canal, Outside Canal & Helm Ditch. Excludes diversions through Outside Canal to Dr.E.L.Mott & Panoche Water Distribution Assn. & also Sam Hamburg's diversions from June 15 through Sept. 15. Also excludes diversions through the various canals of the San Joaquin Canal Company to the Grass Lands Water Association.
(f) Point of diversion is considered to be Mendota Pool.
(g) Includes some double cropping and interplanting.
(h) One 42" unit installed in 1950.
(i) Of this total 1625 acres were double cropped.
(j) Re-diverted from Outside Canal by means of 2-12" pumps on intake channel at Mile 18.24L below head & 2-12" pumps at Mile 19.24L below head.
(k) Conveyance losses between head of Outside Canal & lift pumps amounted to approximately 128 acre-feet of this figure. Net of 2337 diverted through lift pumps.
(l) Re-diverted from Outside Canal by 3-30" & 2-24" pumps at Mile 23.58L below head.
(m) Conveyance and other losses amounted to 1110 acre-feet of this figure. Net of 26635 diverted through lift pumps.
(n) Re-diverted from Outside Canal by 2-16" & 1-24" pumps on intake channel located at Mile 25.75L below head. Except for the June 15, September 15 period, water was received from San Joaquin Canal Co.
(o) Conveyance losses amounted to 123 acre-feet of this figure. Net of 3184 diverted through lift pumps.
(p) Formerly listed as Eugene Ham.
(q) Pumps operated at various locations along river.
(r) Combined acreage and diversions of this plant and plants at Miles 215.62L and 215.63L.
(s) Pump operated at various locations along river and Mowry Canal. Formerly listed at Mile 214.63L.
(t) See plant at Mile 215.25L.
(u) New installation in 1950.
(v) Formerly listed as Webster Brothers.
(w) Point of diversion is at head of Mowry Canal.
(x) Formerly listed as F. A. Yearout.
(y) Combined acreage and diversion of this plant and plants at Miles 221.35L and 227.86L.
(z) Point of re-diversion is on Lone Willow Slough at Mile 2.2R.
(aa) Delivery is through Chowchilla Canal re-diverting from Lone Willow Slough 2.3 Miles below head.
(bb) Of this figure 737 acres were double cropped.
(cc) Formerly listed at Mile 222.36L.
(dd) See plant at Mile 219.01L.

* Distance along San Joaquin River from its mouth 4⅛ miles below Antioch. (Mileage as established by War Department Survey 1913-15).
(a) Of this figure 76 acres were double cropped.
(b) An undetermined amount of water received from Fresno Irrigation District.
(c) Formerly listed as G. V. Hart.
(d) Formerly listed as P. J. Vincent.
(e) Reported in 1949 as No Diversion. Should have been 5 acres general crops and an estimated diversion of 10 acre-feet.
(f) This figure partially estimated.
(g) An undetermined amount of water received from wells.
(h) An undetermined amount of water received from Fresno I. D. and from wells.
(i) Combined acreage this plant and one at Mile 247.65R.
(j) See plant at Mile 247.64R.

* Distance along San Joaquin River from its mouth 4¾ miles below Antioch. (Mileage as established by War Department Survey 1913-15).
** Pertinent data furnished by U.S.B.R.
(a) This is supplemental water for acreages as follows: Lindsay-Strathmore I. D. 10,000, Lindmore I. D. 1750, Tulare I. D. 25909, Orange Cove I.D. 5750, Delano-Earlimart 3910, Lower Tule I. D. 7654, Stone Corral I. D. 1000, Ivanhoe I. D. 8867, Exeter I. D. 1700, Porterville I. D. 2500, Terra Bella I. D. 2404, Saucelito I. D. 1500.
(b) Diversion contracts with U.S.B.R. are limited to one year periods.
(c) Point of delivery is considered to be "canal side". Points of diversion are at Hildreth Creek Turnout Mile 13.16; Fresno River Wasteway, Mile 18.8L; Dry Creek, Mile 24.2L; Berenda Creek, Mile 30.4L.
(d) Of this amount 22039 acre-feet were used for surface irrigation and 28489 acre-feet served to replenish ground water supply. An undetermined amount of water received from wells.
(e) Point of delivery is Madera Canal at Mile 35.6.
(f) Of this figure 24036 acre-feet were used for surface irrigation and 41971 acre-feet served to replenish the ground water supply.

* The water in Fresno Slough and Fresno Slough By-Pass is mainly derived from the San Joaquin River by the Mendota Pool backwater created by Mendota Dam, and is occasionally augmented by Kings River via Fresno Slough By-Pass.
** Mileages listed are miles above the mouth of Fresno Slough. Mouth of Fresno Slough is at Mile 208.93 above mouth of San Joaquin River.
*** Plant is located on Fresno Slough By-Pass which joins Fresno Slough at Mile 11.8R. Distance along Fresno Slough By-Pass from Fresno Slough is indicated in ().
(a) Diversion contracts with U.S.B.R. are limited to one year periods.
(b) An undetermined amount of water received from wells.
(c) Formerly listed as S.L. Heisinger and P.R. Engleman.
(d) Acreage estimated all gun club lands, flooded once.
(e) New installation in 1950.
(f) Combined diversion & acreage of this plant & plants at Miles 7.1L & 8.2L.
(g) See plant at Mile 6.45L.
(h) These diverters received supplemental water by temporary annual contracts with U.S.B.R.
(i) Combined diversion and acreage of this plant and plant at Mile ***(0.75). An undetermined amount of water received from wells.
(j) See plant at Mile 9.6R.
(k) Combined diversion and acreage of this plant and plant at Mile 13.25R. An undetermined amount of water received from Kings River via James Main Canal.
(l) Scattered flooding of grazing land and gun club.
(m) See plant at Mile ***(4.4).
(n) Combined acreage and diversion of this plant and plant at Mile 15.9L. An undetermined amount of water received from wells and from the Kings River through Beta Main Canal. Kings River water obtained from April 29 through May 8 and from May 21 through June 16, 1950.
(o) See plant at Mile 14.1L.

(a) Additional acre-feet diverted: January 1.
(b) Additional acre-feet diverted: November 2.
(c) Additional acre-feet diverted: November 402. An undetermined amount of water received from East Side Canal.
(d) Additional acre-feet diverted: November 10. Total acre-feet diverted for years 1948 and 1949 were listed in the respective annual reports as: 1948 was 59 and 1949 was 91. These listings should have been as follows: 1948 acre-feet 159 and 1949 acre-feet 248.
(e) Additional acre-feet diverted: November 4.
(f) Of this figure 76 acres were double cropped.
(g) The 6" unit installed in 1950.
(h) Portable unit diverting water at plants at Miles 11.7R, 12.8R and 13.4R.
(i) Additional acre-feet diverted: November 17. An undetermined amount of water received from wells.
(j) Additional acre-feet diverted: November 1.
(k) Additional acre-feet diverted: November 61. An undetermined amount of water received from wells.
(l) The 6" unit replaces 2-6" portable units formerly listed at this location.
(m) Portable units diverting water at plants at Miles 14.8R and 15.4R.
(n) New installation in 1950.
(o) Additional acre-feet diverted: November 19.
(p) Of this figure 13 acres were double cropped.
(q) Portable units diverting water at plants at Miles 18.1R, 18.6R and 20.3R.
(r) Formerly listed as Frank P. Dutra.
(s) An undetermined amount of water received from wells.

(a) Formerly listed as C.M. Carroll.
(b) Formerly listed as A. Bianchi and Thomas Madson.
(c) Additional acre-feet diverted: February 7.
(d) Additional acre-feet diverted: November 2.
(e) Additional acre-feet diverted: February 16.
(f) Of this figure 25 acres were double cropped.
(g) Additional acre-feet diverted: November 7.
(h) Of this figure 27 acres were double cropped.
(i) Of this figure 53 acres were double cropped.
(j) The 12" unit at this location replaces the 6" unit formerly listed at Mile 13.3R.
(k) An undetermined amount of water received from Modesto I.D.
(l) The 14" unit at this location replaces the 10" unit formerly listed at Mile 18.5R.
(m) New installation in 1950.
(n) Additional acre-feet diverted: February 6.
(o) Oakdale I.D. for season of 1950 maintained plants at Miles 35.9L and 37.0L to supplement district gravity supply.
(p) Additional acre-feet diverted: February 11.
(q) Of this figure 200 acres were double cropped.
(r) An undetermined amount of water received from wells.
(s) Of this figure 40 acres were double cropped.

(a) Not listed prior to 1950.
(b) New installation in 1950.
(c) Approximate mileage of Goodwin Dam.
(d) Additional acre-feet diverted in 1949: December 2686. Additional acre-feet diverted in 1950: January 9528 and February 11713.
(e) Includes 5289 acres served by sub-irrigation. Received an undetermined amount of water from controlled drainage and deep wells.
(f) This is combined acreage for the Norhtside and Southside Canals. Additional acreages served from plants on Stanislaus River at Miles 35.9L and 37.0L.

* Mileage indicated in miles downstream from Junction with South Fork of Tule River.

(a) By agreement all the flow of the Tule River from March 19th to April 10th each year is for use by those diverters below Ottle Bridge. With a firm water supply, the diversion from the Tule River would extend throughout the entire twelve months of each year. Supplemental diversion from wells becomes total source of water as flows of the Tule River ceases to be available.

(b) The total service areas of the Ditch Companies are as follows: Pioneer Ditch Co., 2395 acres; Campbell-Moreland Ditch Co., 1300 acres; Porter Slough Ditch Co., 2720 acres; Vandalia Irrigation District, 178 acres; Poplar Ditch Co., 7440 acres; Hubbs-Miner Ditch Co., 1935 acres; Gilliam-McGee Ditch Co., 360 acres; Rhodes-Fine Ditch Co., 1180 acres; Woods Central Ditch Co., 2360 acres and Little Pioneer Ditch Co., 1020 acres.

(c) Installed prior to 1950, not previously listed.

(d) The flood flows during November and December were not recorded.

(e) This is a supplemental point of diversion for normal point of diversion from South fork of Tule River via Wilcox Ditch.

(f) An undetermined amount of water used to replenish ground water. Also served water to Vandalia Ditch at Mile 3.9L.

(g) Use other than for replenishing of ground water is negligible.

(h) Point of diversion is on Porter Slough, 4.5 Miles from head of Slough.

(i) An undetermined amount of water used to replenish ground water. An undetermined amount of water received from Campbell-Moreland Ditch at Mile 3.2L.

(j) This figure is measured diversion at head minus measured spill to river at Mile 12.9R. Hubbs-Miner Ditch Co. receives approximately 71.4 per cent of measured diversion at head while Gilliam-McGee Citch Co. receives approximately 28.6 per cent.

(k) Includes 1225 acres in the Hubbs-Miner Ditch Co. and 350 acres in the Gilliam-McGee Ditch Co.

(l) Includes acre-feet derived from delivery from Friant-Kern Canal as follows: May 483, June 1527, July 1167 and August 1041.

(m) Includes acre-feet derived from delivery from Friant-Kern Canal as follows: May 303, June 590, July 103 and August 288.

(n) Diversion prior to 1950. Not previously listed.

(o) Diversion in acre-feet as shown is derived as follows: Total flow listed at Tule River above Little Pioneer Ditch minus Little Pioneer Ditch diversion.

(p) No record available for Riparian users below Ottle Bridge for months of November and December in 1950. Includes acre-feet derived from delivery from Friant-Kern Canal as follows: May 6829, June 23070, July 13647 and August 11192.

(q) No segregation is made to individual users.

(a) Excluding such diversions for municipal use as the City of Sacramento and the City of Redding.

TABLE 192

RICE ACREAGE IN CALIFORNIA

A Comparison of Total Rice Acreage in California with Rice Acreage Irrigated from the Sacramento and San Joaquin River Systems Covered by Sacramento-San Joaquin Water Supervision

Rice Acreage							
Year	Total in State	Irrigated from Sacramento & San Joaquin River Systems	Ratio in Per Cent (b)	Year	Total in State (a)	Irrigated from Sacramento & San Joaquin River Systems	Ratio in Per Cent (b)
1924	90000	89000	99	1937	149000	109000	73
1925	103000	95000	92	1938	125000	95000	76
1926	149000	129000	87	1939	120000	104000	87
1927	160000	123000	77	1940	118000	94000	80
1928	132000	101000	76	1941	153000	120000	78
1929	95000	74000	78	1942	212000	159000	75
1930	110000	88000	80	1943	237000	186000	77
1931	125000	126000	100	1944	246000	200000	81
1932	110000	91000	83	1945	239000	187000	78
1933	108000	87000	80	1946	255000	200000	78
1934	108000	92000	85	1947	250000	215000 (c)	86
1935	100000	78000	78	1948	248000	193000	81
1936	138000	104000	75	1949	298000	236000	79
				1950	240000	187000	78
				Average 1924-1950	164000	132000	80

(a) As reported by Federal-State Crop Reporting Service.
(b) Ratio of acreage on Sacramento and San Joaquin River systems to total State acreage.
(c) Prior to 1947 rice acreage on Upper San Joaquin River was not included.

TABLE 193

MAXIMUM RECORDED SALINITY AT PRESENTLY INDICATIVE BAY AND DELTA STATIONS

(Releases of stored water from Shasta Reservoir commenced in 1944.)

YEAR (a)	1931	1934	1938	1939	1944	1945	1946	1947	1948	1949	1950

(a) For maximum salinities recorded and not shown in this table, see previous reports.
(b) Normal taken as 60-year (1889-1949) mean annual unimpaired flow (Oct.-Sept., incl.) at foothill stations of major tributaries.
(c) For location and description see Table 194.
(d) Record incomplete.
(e) Estimated.

TABLE 194

DESCRIPTION OF ACTIVE SALINITY OBSERVATION STATIONS - 1950

(Refer to previous Water Supervision Reports for description of stations which have been discontinued.)

STATION	Miles from Golden Gate (a)	Time Interval (b) Hours	Time Interval (b) Mins.	LOCATION
				SAN FRANCISCO, SAN PABLO AND SUISUN BAYS
Point Orient	12.3	2	20	North end of San Francisco Bay, East Shore, one-half mile south of Point San Pablo Wharf of Standard Oil Company.
Point Pinole	19.0	2	50	South Shore of San Pablo Bay, at Point Pinole on wharf of Atlas Powder Company.
Point Davis	25.2	3	15	East end San Pablo Bay, South Shore, Oleum Wharf of Union Oil Company.
Grand View	25.2	3	15	Northwest shore of San Pablo Bay at mouth of Petaluma Creek.
Crockett	27.7	3	30	West end of Carquinez Strait, South Shore, 0.2 mile east of Carquinez Bridge on wharf of C. and H. Sugar Refining Corporation.
Benicia	32.5	3	50	East end of Carquinez Strait, North Shore, 1.1 mile west of Southern Pacific Company railroad bridge, at Benicia Arsenal.
Martinez	32.7	3	50	East end of Carquinez Strait, South Shore, 1.0 mile west of Southern Pacific Company railroad bridge, at Municipal Ferry Slip.
West Suisun	37.0	4	10	West end of Suisun Bay, North Shore, 2.5 miles northeast of Southern Pacific railroad bridge at service pier of U. S. Maritime Commission, Reserve Fleet Mooring area.
Port Chicago	41.0	4	20	South Shore of Suisun Bay at U. S. Naval ammunition loading wharf below Port Chicago.
O & A Ferry	46.5	4	40	Upper end Suisun Bay between Mallard Station and Chipps Island at Sacramento Northern Railroad Ferry Crossing.
Innisfail Ferry	47.3	4	50	Montezuma Slough, about one mile east of junction with Cutoff Slough near North end of Grizzly Island.
Pittsburg	48.0	5	00	East end of Suisun Bay, South Shore, at Pittsburg Yacht Harbor.
				SACRAMENTO RIVER DELTA
Collinsville	50.8	5	25	Sacramento River, North Bank at junction with San Joaquin River.
Three Mile Slough Bridge	60.0	5	55	At junction of Slough and Sacramento River.
Rio Vista Bridge	63.5	6	05	At Highway Bridge near Northerly limits of Rio Vista.
Isleton Bridge	68.7	6	30	Sacramento River, one mile upstream from Isleton.
				MOKELUMNE RIVER DELTA
Terminous	83.4	7	50	South Fork Mokelumne River at Terminous.
				SAN JOAQUIN RIVER DELTA
Winter Island	53.1	5	50	Upper end of Winter Island, north shore New York Slough at junction of Broad and New York Sloughs.
Antioch	54.9	5	55	San Joaquin River, at City Water Works pumping plant.
Millers Harbor	58.2	6	10	South Shore San Joaquin River at Antioch Bridge.
Jersey Island	61.4	6	20	San Joaquin River, left bank, one mile below mouth of False River.
Opposite Central Landing	72.0	7	00	Mokelumne River, on Andrus Island directly opposite Central Landing on Bouldin Island.
Dutch Slough	73.0	7	05	At Bethel Island Bridge.
Empire Bridge	84.2	8	00	Honker Cut between Empire Tract and King Island at Empire Bridge.
Rindge Pump	86.1	8	10	San Joaquin River, north bank, one mile below Fourteen Mile Slough Junction.
Orwood Bridge	86.3	8	10	Old River, at Santa Fe Railroad Crossing, Orwood.
East Contra Costa I. D.	86.7	8	20	Indian Slough, at East Contra Costa Irrigation District Pumping Plant.
Victoria Island	89.6	8	35	Old River at Borden Highway Crossing.
Clifton Court Ferry	94.2	9	10	Old River just below junction with Grant Line Canal.
Stockton Country Club	94.8	9	15	Near Head of Stockton Channel at Wharf of California Transportation Company.
Garwood Bridge	95.3	9	15	San Joaquin River, at Drawbridge one mile above Santa Fe Railroad Crossing.
South Fabian	100.0	9	40	Old River, two miles East of Bethany.
Grant Line Bridge	101.0	9	50	Grant Line Canal, 5.5 miles above junction with Old River, at Tracy Road Crossing.
Williams Bridge	101.6	9	55	Middle River, about four miles below Salmon Slough Junction.
Mossdale Bridge	108.5	10	50	San Joaquin River at U. S. 50 Highway Crossing about three miles southwest of Lathrop.
Vernalis (Durham Ferry Bridge)	127.0	11	00	San Joaquin River at Durham Ferry Bridge, above tidal influence.

(a) Mileage measured to station along main channel. For stations off the main channel, the mileage shown is the same distance along the main channel to a point whereon the time of the occurrence of the tidal phase is the same as that of the observation station.

(b) Time interval between high tide at Golden Gate and time for taking samples at station.

TABLE 195

SALINITY OBSERVATIONS, SACRAMENTO-SAN JOAQUIN DELTA AND UPPER BAYS

Samples taken by local observers approximately one and one-half hours after high high tide.
Salinity expressed in parts of chlorine per 100,000 parts of water.

(*) Presumed.
(**) New station established 12/27/50 on Stockton Canal opposite Rindge Pump.

(a) Taken at Low High Tide.
(b) Taken on following day.
(c) Taken two days later.

(d) Taken over 1 hour off scheduled time.
(e) Taken on preceding day.

* Normal = 60-year (1889-1949)mean annual unimpaired flow (Oct.-Sept.,incl.).
(1) Does not include inflows from Mokelumne and Calaveras rivers, Yolo By-Pass and other minor tributaries.
(2) Delta area taken at 435,000 acres which includes all lands, levees, water surfaces, etc., within Delta boundary.
(3) Sacramento and Mokelumne deltas combined as the Sacramento River contributes a large flow to Mokelumne River Delta through Georgiana and Three Mile sloughs.
(4) No continuous record. Lowest discharge measured.
(5) Figure shown is minimum 10-day flow during summer. Minimum 10-day flow for year occurred March 8 with average flow of 357.
