ACKNOWLEDGMENT

Valuable assistance has been rendered by many individuals and by many public and private agencies in the conduct of the field work and the preparation of data for this report of the Sacramento-San Joaquin Water Supervision activities.

Landowners, water users, and the executives, engineers, managers, and superintendents of various water organizations throughout the territory covered by this work have cooperated fully in furnishing the many varied data requested.

The Pacific Gas and Electric Company, the Sacramento Municipal Utility District, and the Merced, Modesto, and Turlock Irrigation Districts have furnished a large number of electric power consumption records for use in the compilation of pumped diversions.

The United States Geological Survey, Department of Interior, has extended valuable cooperation in gathering and assembling stream flow data.

The United States Bureau of Reclamation, Department of Interior, has furnished data relating to inflows and operation releases of Shasta Lake and Millerton Lake (Friant Reservoir).

The City of San Francisco Public Utilities Commission, Hetch Hetchy Water Supply, Kings River Water Association, San Joaquin Canal Company, Corcoran Irrigation District, Kern County Land Company, Tulare Lake Basin Water Storage District, and the United States Bureau of Reclamation have made available stream flow data for certain San Joaquin Valley streams.

The Modesto, Oakdale, and Turlock Irrigation Districts have assisted in observing and maintaining recording gages in the San Joaquin Valley area.

The United States Bureau of Reclamation provided the funds necessary to maintain the regular program of salinity observations in the Sacramento-San Joaquin Delta during 1953.

FOREWORD

A contract between the United States and the Department of Public Works provides for the performance by the Division of Water Resources of certain hydrographic work formerly performed by the U. S. Bureau of Reclamation and the continuation of the Sacramento-San Joaquin Water Supervision activities of the Division of Water Resources. The original contract, designated as U. S. Bureau of Reclamation Contract No. I75r-1596 and Division of Water Resources Agreement No. 3-170, was executed on December 30, 1948, became effective October 1, 1948, and expired on March 31, 1952. A new contract, providing for the same scope of work with some minor revisions, was entered into on March 31, 1952, for a three-year period ending March 31, 1955, and was designated as U. S. Bureau of Reclamation Contract No. I75r-4504 and Division of Water Resources Agreement No. 3C-600.

The work performed during 1953 by the Division of Water Resources under this contract included the collection of data on stream flows and diversions of the Sacramento and San Joaquin Rivers and their tributaries formerly obtained by both agencies and in addition data formerly obtained by the Bureau of Reclamation on measurements of inflows to Tulare Lake, temperacures of water, and detailed crop surveys of specified areas in the Sacramento Valley. In accordance with the terms of this contract, the Division transmitted to the Bureau of Reclamation periodic hydrographic reports for the latter's use in the operation of the Central Valley Project.

SACRAMENTO-SAN JOAQUIN WATER SUPERVISION

Water Supervision activities, resulting from the efforts of the first Sacramento-San Joaquin River Problems Conference and its Permanent Committee working with the former Division of Water Rights, were inaugurated in 1924. A complete description of the origin, history and conduct of the work is found in the 1924 and 1926 Biennial Reports of the former Division of Water Rights, in Bulletin Number 4 of that Division, and in Bulletin Number 23 of the succeeding Division of Water Resources. The latter bulletin brings together all data and measurements obtained in the first five-year period, 1924 to 1928, inclusive. Annual Water Supervision reports for subsequent years are in separately bound books similar to this report.

Objectives

At the outset, the objective of the work of Water Supervision in the valley floor areas along the Sacramento and San Joaquin river system was to afford relief to water users from the difficulties of obtaining irrigation supplies occasioned by uncoordinated diversions during years of substantially subnormal runoff. The situation called for voluntary regulation of diversions in order to alleviate as far as possible the damage from the serious shortages in the water supplies needed for irrigation, municipal consumption, salinity control in the Sacramento-San Joaquin Delta, and navigation purposes. Equitable coordination of diversions was accomplished primarily through the Water Supervision program.

There is no agreement between the water users under which a watermaster might distribute the natural water supply equitably to those entitled to receive it, but it appears inevitable that such an agreement, embracing a definite schedule of relative water rights, will be developed. Its realization will require, however, reliable data, covering a long period of years, on the actual diversions and uses of water, stream flows, stream accretions and salinity encroachment into the Sacramento-San Joaquin Delta. Looking toward that end, it has been the objective of the Division of Water Resources through its Water Supervision work, to collect and record all of the basic hydrographic data necessary to formulate an intelligent and practicable agreement.

A "Memorandum of Understanding Relating to a General Approach to Negotiations for Settlement of Water Diversions from the Sacramento River and the Sacramento-San Joaquin Delta with the Objective of Avoiding Litigation" was entered into on July 7, 1952, by the Bureau of Reclamation, the Sacramento Valley Water Users Committee, and the State of California. The execution of this Memorandum of Understanding following more than 30 years of contention among various water diverters over their respective rights to divert water from the Sacramento River, and subsequent changes in stream flow regimen and other complications attributable to the construction and operation of the Central Valley Project by the United States, opened the way toward an amicable approach to a settlement of these

differences. By utilizing data gathered by the Sacramento-San Joaquin Water Supervision function of the Division of Water Resources during the past thirty years, studies were made to formulate various diversion schedules which would adequately supply the diverters of water along the Sacramento River in consonance with Delta diversions and uses and with the operation of the Central Valley Project. These studies progressed by September, 1953, to the point where it became apparent in the office of the State Engineer that a diversion schedule for the diverters of water upstream from the latitude of the City of Sacramento should be tentatively established and tested by trial distribution and detailed observation, and recordation.

Scope of Work

The area embraced by the Sacramento-San Joaquin Water Supervision work lies on the Sacramento and San Joaquin Valley floors. It specifically covers all of the lands irrigated from the Sacramento River between Redding and Sacramento, including those irrigated from the Colusa Trough, Back Borrow Pit, Knights Landing Ridge Cut, and Yolo By-Pass above West Sacramento, from Lower Butte Creek and Butte Slough, from the Feather River below Oroville, from the Yuba River below Smartville, from the Bear River below Wheatland, from the Sutter By-Pass and Sacramento Slough, from the American River below Fair Oaks, from the Cosumnes River below Michigan Bar, from the Mokelumne River below Clements, from the Calaveras River below Jenny Lind, from the San Joaquin River between Friant Dam and Mossdale Bridge, from the Merced River below Snelling, from the Tuolumne River below La Grange, from Dry Creek (tributary to Tuolumne River) below Oakdale-Waterford road, from the Stanislaus River below Knights Ferry, and from the Tule River below South Fork, and the irrigated areas lying on the "uplands" side of and receiving water from the San Joaquin River between Mossdale Bridge and Stockton, Old San Joaquin River and Tom Paine Slough. The area covered and its geographical relation to the Central Valley Drainage Basin are shown on Plate 1.

Water Supervision Activities

The work of the Sacramento-San Joaquin Water Supervision unit of the Division of Water Resources is divided into two portions: field work, mainly during the spring, summer and fall months, and office work during the winter and early spring months.

The field activities include:

(1) Measurement of stream flow passing the many recording stations along the river and drainage channels;

(2) Measurements of the amounts of water diverted and collection of records of use by each water user;

(3) Measurements of the amounts of water returned to natural channels, through drainage plants or gravity drains, for possible re-use;

(4) Obtaining an annual census of irrigated acreages and crops supplied by either a primary, or drainage water supply, or both;

(5) Maintaining the Delta salinity observation program;

(6) Cooperation with and assistance to water users in connection with individual problems of diversion; and

(7) Assistance with hydrographic activities of cooperating public and private agencies, and of other units of the Division.

The office work comprises mainly the assembly, computation and analysis of hydrographic and other data collected during the field season for presentation in the annual report of Water Supervision. This report contains the basic records of water supply available to, and the water utilization by, each user of water from the streams covered in the area. The computation of stream flow. drainage and accretions involves the conversion of the recorded daily gage records to figures showing the daily flows in second-feet and monthly runoffs in acre-feet. The computation of the amounts of water diverted by each water user involves the calibrating and rating of suitable measuring devices at each point of gravity diversion and the calibrating and rating of each pumping plant diversion usually based on its electric power consumption and efficiency. The final computations of the diversion quantities, as shown in this report, are the result of giving full consideration to all measurements and records of operation during the entire season for each individual diversion. The results of these computations are then compiled in the tabulations in this report for the purpose of giving basic records that are readily usable by all interested parties. The office work also includes the preparation of certain hydrographic data in form to be used as a guide in the ensuing season's field work.

In accordance with the provisions of Contract No. 3C-600 between the Division of Water Resources and the U. S. Bureau of Reclamation. the Division has computed, on a preliminary basis, the daily mean flows at 31 stream flow stations, and the diversions by reaches, from the main streams and tributaries in the Sacramento and San Joaquin valleys and has transmitted the results of these computations monthly to the Regional headquarters of the Bureau of Reclamation.

The office work in connection with the program of observing Delta salinity conditions consists of collating the results of the chloride tests from samples taken at four-day intervals at each observation station. These salinity records are presented each month in a bulletin which is distributed to governmental agencies and to many individuals and organizations that are interested in the results.

Hydrographic Activities of Cooperating Agencies

The United States Geological Survey, Water Resources Branch, through continued cooperative agreements with the Division of Water Resources, has maintained a series of stream gaging stations in the Sacramento and San Joaquin valleys. A large amount of the stream flow data contained in this report has been collected and computed by the Geological Survey, much of which has been completed and made available for inclusion in this report prior to its official publication in Federal reports.

The Modesto, Oakdale, South San Joaquin, and Turlock Irrigation Districts in the San Joaquin Valley have cooperated with Water Supervision engineers by assisting in the installation of certain recorder equipped stream gaging stations. The Kings River Water Association, Kern County Land Company, Corcoran Irrigation District, and Tulare Lake Basin Water Storage District have cooperated in furnishing records of stream flow for inclusion in this report.

The City of San Francisco Public Utilities Commission, Hetch Hetchy Water Supply, has continued to cooperate with the Water Supervision engineers by maintaining, operating, and compiling records from a series of stream gaging stations on the San Joaquin and Tuolumne Rivers in the San Joaquin Valley.

The United States Bureau of Reclamation, through its offices at Sacramento and Fresno, cooperated by operating recorders and furnishing records of flow at certain stations.

The specific degree of cooperation by these agencies with Water Supervision engineers is detailed in footnotes on the many stream flow tabulations contained in this report.

SHASTA AND MILLERTON LAKE OPERATIONS

Shasta Lake (Shasta Reservoir) on the Sacramento River above Redding was first used to store water for irrigation use during the winter of 1943-44 and releases for supplemental irrigation water along the Sacramento River commenced in the late spring of 1944. The release of water from the lake since 1944 has substantially altered the regimen of flow of the Sacramento River and in many respects greatly benefited conditions along that stream. However, it has also created added diversion and drainage problems.

Millerton Lake (Friant Reservoir) on the San Joaquin River near Friant was first used to store water for irrigation use during the winter and spring of 1943-44 and the first releases for supplemental irrigation water occurred during 1944. Friant Dam was operated during 1953 to divert water into Friant-Kern and Madera Canals, and to regulate releases in coordination with deliveries through Delta-Mendota Canal.

The operations of Shasta and Millerton Lakes are under the jurisdiction of the United States Bureau of Reclamation.

Reservoir Data

Shasta Lake is created by a gravity concrete dam, 528 feet high above stream bed, located 13 miles upstream from Redding. The gross capacity of the reservoir with spillway gates closed is 4,500,000 acre-feet, of which a space of 4,000,000 acre-feet will be available for the active storage of water and 500,000 acre-feet of space will be reserved for silt deposits and to create head for the generation of power. The steel spillway drum gates were installed in 1948, thus providing a storage of 786,000 acre-feet

above the 3,714,000 acre-feet at the fixed crest of the spillway. There will be sufficient water to fill the entire storage capacity in all years of normal or greater than normal runoff above the dam. Water from the lake is conveyed through the Sacramento Valley in the channel of the Sacramento River.

Millerton Lake, on the San Joaquin River, is created by a gravity concrete dam about 275 feet high above streambed, and is located at the base of the foothills about 20 miles northeast of Fresno. The gross capacity of the reservoir with spillway gates closed, is 520,000 acre-feet, of which a space of 404,000 acre-feet between the top of the spillway gates at elevation 578 and the bottom of the Friant-Kern Canal outlet at elevation 459.4 feet is available for the storage of water for flood control and to supply irrigation demands in the San Joaquin Valley. The major portion of the water from Millerton Lake is being conveyed through the Madera and Friant-Kern Canals to lands north and south of the San Joaquin River in Madera, Fresno, Kings, Tulare, and Kern Counties. The spillway gates on Friant Dam were completely installed in 1948, thus providing a storage of 84,000 acre-feet above the 350,000 acre-feet of space between the fixed crest of the spillway at elevation 560 feet and the bottom of the Madera Canal outlets at elevation 442.2 feet.

Shasta Lake Operation - 1953

Shasta Lake was designed to (1) furnish water for irrigation in the Sacramento and San Joaquin valleys, including the Sacramento-San Joaquin Delta area; (2) provide salinity control in the Delta by maintaining a flow in the lower Sacramento River sufficient to repel the intrusion of salt water from Suisun Bay; (3)control floods on Sacramento River; (4) provide sufficient depths for navigation on the Sacramento River between Sacramento and Chico Landing; and (5) generate hydroelectric power.

Although the storage of water in the lake commenced in the early part of the winter of 1943-44, the ensuing season's subnormal runoff into it was not sufficient to fill the lake to the spillway lip. However, the United States Bureau of Reclamation was able to release sufficient stored water throughout the irrigation season of 1944 to augment the natural stream flows and thereby facilitate diversions of those natural flows by the diverters along the Sacramento River.

Since 1944, including 1953, the quantity of water in storage in Shasta Lake was sufficient to afford releases (1) to facilitate irrigation diversions by maintaining higher river levels along the Sacramento River, (2) to sustain minimum flow for navigation of approximately 5,000 second-feet upstream from Knights Landing, (3) to supplement irrigation supplies in the Delta area below Sacramento, (4) to control salinity, and (5) to supply water for exportation via the Delta-Mendota and Contra Costa Canals. The Delta Cross Channel near Walnut Grove was operated during 1953 allowing approximately 3,000 second-feet of Sacramento River water to be transferred into the San Joaquin portion of the Delta. This flow afforded approximately 2,500 second-feet of water for exportation by the Delta-Mendota and Contra Costa Canals and aided in maintaining the stream flow out of the Delta into Suisun Bay sufficient to hold the line of excess saline concentration (1000 ppm of chlorides) to the lower end of Sherman Island.

The daily mean second-foot flows into Shasta Lake during 1953 are given in Table 7. These inflows to the reservoir are representive of the amounts of water that would have been flowing in the Sacramento River at the dam site if the dam had not been built. The inflow figures are computed by combining the effects of daily change in storage, reservoir evaporation, releases and spill.

A tabulation of the daily amounts of water in storage in Shasta Lake during 1953 is given in Table 8. The daily mean second-foot flows as measured below Shasta Dam at the United States Geological Survey station near Keswick are given in Table 9. The flows at the Keswick station are the same as the releases from Shasta Lake except for daily regulation by Keswick Reservoir and the amounts of inflow between the station and Shasta Dam. The amounts of this inflow are small during the irrigation season, and can be ignored, so that the average daily flows at the gaging station are nearly the same as the releases from the reservoir during that period.

A chart depicting the operation of Shasta Lake for 1953, as prepared by the U. S. Bureau of Reclamation, giving the inflows to the lake, the amounts released, the water surface elevations, and the amounts of water in storage, is shown on Plate 2.

Millerton Lake (Friant Reservoir) Operation - 1953

Millerton Lake is used only for the storage of water for flood control and irrigation purposes. The daily mean second-foot inflows to Millerton Lake during 1953 are given in Table 109. A daily tabulation of the amounts of water in storage in the lake during 1953 is given in Table 110. The daily mean second-foot flows, as measured at the United States Geological Survey gaging station below Friant, are given in Table 111. These flows are the same as the releases from Millerton Lake except for the amounts of inflow between the station and Friant Dam. The amounts of this intermediate inflow are small during the irrigation season so that the measured flows at the gaging station are practically the same as the releases from the reservoir during that period. A chart depicting the operation of Millerton Lake for 1953, as prepared by the U. S. Bureau of Reclamation, giving the same data as are shown by the chart for Shasta Lake, is also shown on Plate 2.

During the 1953 irrigation season, water stored in Millerton Lake was released into the Madera Canal, the Friant-Kern Canal, and into the channel of the San Joaquin River. Diversions by the Madera Canal served largely to aid in the replenishment of ground water supplies in the Madera area. The quantities of diversions into the Madera and Friant-Kern Canals are shown in Table 186. The regulated releases flowing down the San Joaquin River served not only the irrigation requirements of the lands along that stream above the head of the Gravelly Ford Canal, but also the requirements of the numerous diversions below that point to Temple Slough in coordination with the deliveries of water through the Delta-Mendota Canal.

RUNOFF AND WATER SUPPLY

The variable flows of the streams entering the Sacramento and San Joaquin valleys on the north and east sides result from the rainfall runoff occurring each winter and spring season principally from December to April, the snowmelt runoff occurring during the spring and summer seasons from March through June, and a combination of runoff from perennial springs and released stored water during the summer and fall seasons. Flood flows in the valley floor channels are caused by runoffs from rainfall and melting snow in the mountain areas in excess of mountain reservoir capacities, and by rain storm runoff from the vast area of minor foothill watersheds and valley floor lands. Some incidental flood control is accomplished by reservoirs in many of the tributary watersheds including those of the Sacramento, Feather, Yuba, Stanislaus, Tuolumne, Merced, and San Joaquin Rivers. The extent of the flood flows in 1953 is given by the tabulations of daily stream flows, Tables 9 through 167.

During the summer irrigation season, variations in flow of the streams on the valley floor are affected, (1) by the combination of diversions from the streams for irrigation and of accretions to the streams from both direct surface drainage and seepage from ground water, and (2) by releases of stored water for irrigation, navigation, salinity control, and the generation of electric power.

1953 Inventory of Runoff

A comprehensive summary and inventory of the monthly stream flows, diversions and accretions, in acre-feet, is contained in Tables 2, 3, and 4. This inventory is arranged to give these data for each reach of each stream covered by Water Supervision work in a summarized ready-reference form. The inventory is designed to give a picture of the complete disposition of the season's water supply, with stress upon the amounts of losses or gains in flow along each reach of each stream.

1953 Runoff Comparisons

A comparison of the unimpaired flows for the period 1920-1953, in the major streams tributary to the Sacramento and San Joaquin valleys in per cent of a 60-year normal is given in Table 1. This table was recomputed in 1950 from original data furnished by the Snow-Survey section of this Division which was based on a 60-year (1889-1949) normal runoff. The annual runoff figures given in Table 1 have been modified by as much as five per cent from the corresponding figures given in Table 1 of the Water Supervision reports prior to 1950. These changes were the result of the change from a 50-year normal to a 60-year normal and of the omission of the runoff from the Calaveras, Cosumnes, and Bear Rivers in the computations of the new 60-year normal runoff of Sacramento-San Joaquin Rivers to the Delta. As shown in Table 1, the 1953 unimpaired runoff may be summarized as follows:

Stream and Station	Percentage of 60-year normal
Sacramento River at Red Bluff	112 per cent
Sacramento River at Sacramento	107 per cent
San Joaquin River at Friant	63 per cent
San Joaquin River at Vernalis	70 per cent
Sacramento and San Joaquin Rivers flow to the Delta	97 per cent

A comparison of the season's actual minimum flows is given in Table 209. The minimum 10-day flows during 1953 were:

Stream and Station	Average minimum 10-day flow
Sacramento River at Sacramento	8,020 second-feet
San Joaquin River at Vernalis	650 second-feet
Combined Sacramento and San Joaquin Rivers flow to the Delta	8,690 second-feet

Comparisons with other years indicate that the water supply available during the 1953 season was above normal in the Sacramento Valley and below normal in the San Joaquin Valley. Observations of water utilization and the amounts of residual flows in the streams reaching the Delta in the 1953 growing season indicated that the demands for irrigation and salinity control in the Delta exceeded the natural flow supplies, and the releases of stored water from Shasta Reservoir were of primary importance in maintaining satisfactory river flows and fresh water conditions in the Delta.

Primary Irrigation Supplies

The flows onto the valley floor during the summer season through the major streams are considered to be the primary water supplies for irrigation. This primary water is differentiated from the flows available for irrigation in the lower reaches of the streams resulting from large accretions including the return of a substantial amount, through drainage, from the flows diverted for irrigation upstream. The amounts of primary water available for irrigation in the Sacramento Valley are given in the flow tabulations for those gaging stations located at the edge of the valley floor.

In the San Joaquin River service area, primary water supplies are almost entirely diverted from the upper reaches of the Stanislaus, Tuolumne, and Merced Rivers by the large irrigation districts, and from the San Joaquin River at Friant Dam by the Friant-Kern and Madera Canals. These upper diversions from the Stanislaus, Tuolumne, Merced, and San Joaquin Rivers are included in Tables 191, 189, 188, and 186 respectively. Primary regulated water supplies in the San Joaquin River for irrigation below Friant are measured at the San Joaquin River gaging station below Friant, Table 111. These latter regulated water supplies are almost entirely diverted in the vicinity of Mendota by the large canal companies.

Accretions to Stream Flow

As evidenced by the data for stream flow and diversions, summarized in Tables 2, 3, and 4, there are large quantities of accretions to the flows of the streams and channels in their courses across the valley floors. These accretions are of major importance as available irrigation supplies. They are made up of measured flows from surface drains and of many other flows, not susceptible to direct measurement, from minor ephemeral streams, from scores of small surface drains, from seepage and return of percolated irrigation water, and from escaping underground water normally present as the result of percolated rainfall on the valley floor. The amount of total accretion along any stream reach is the summation of amounts of measured drains plus unmeasured accretions, as shown in these tabulations.

During the summer season, a large portion of the accrete water is derived from upstream irrigation returning to the streams either as surface drainage or waste into open drains or as deep percolation to the ground water from which it finds its way to nearby streams or drains.

Throughout the year, along certain reaches of the stream, the flows are augmented by outflows from seepage of the natural ground water. This portion of the ground water, which is independent of irrigation as a source, is replenished from two other sources, (1) rainfall on the valley floor, a portion of which percolates to the water table during periods of abundant precipitation, and (2) infiltration and escape from stream channels through the banks during high flood flow conditions, later to partially return to that stream when its water levels recede to low flow conditions of the summer and fall.

The figures shown in all reports prior to 1947, giving the relation of "return water in per cent of diversion" as discussed under heading "Drainage and Return Water", may be misleading inasmuch as all accretions, heretofore referred to as "return water", actually may include substantial amounts of ground water seepage not derived from upstream irrigation and unmeasured contributions from small tributaries.

Sacramento Valley Accretions. In the Sacramento Valley all of the accretions to natural and regulated flows which are not diverted on lands north and west of the Sacramento Delta flow into the Delta and are available for use in that area. Practically all of the summer accrete flows in Colusa Trough, Back Borrow Pit, Knights Landing Ridge Cut, and Yolo By-Pass are mainly return waters derived from diversions from the Sacramento River. Since the Sacramento River is the main stream through the Sacramento Valley, the accretions to that stream include substantial amounts of return water from irrigated areas served by water from other sources, particularly the Feather River. A large part of the summer return water flows reaching the Sacramento River through the Butte Slough Outfall Gates (Mile 84.0L) and from Sutter By-Pass through Sacramento Slough (Mile 21.2L) are of Feather River origin. However, the measured flows in Sacramento Slough, Table 54, include not only return water from Feather River diversions but also return water from Sacramento

River diversions into Reclamation District No. 1500, Table 53. In Water Supervision reports prior to 1947, estimates are given showing that bank seepage into the West Borrow Pit of the Sutter By-Pass from Reclamation District No. 1500 amounts to 10 per cent of that district's diversions from the Sacramento River.

Along the Sacramento River between Colusa and Red Bluff there are no large well defined artificial drainage channels. However, records or estimates of natural inflow to the Sacramento River from streams in this reach were obtained where available. Above Red Bluff to Redding there is considerable drainage water from the Anderson-Cottonwood Irrigation District, but it is not recorded.

Along the Feather River, during years of subnormal water supply, practically all of the primary regulated water is diverted upstream from, or at, the Sutter-Butte diversion dam, yet accretions accumulate below that point in amounts sufficient to afford a limited supply for all diversions.

Table 2 is designed to give a summary not only of monthly flows measured on the Sacramento Valley floor, but also the computed monthly amounts of accretions (or losses, as shown by a minus sign preceding the figure) occurring along each reach of each stream between gaging stations. At the end of each series of data for one stream as shown in Table 2, there are summations of diversion and accretion quantities.

In order to compare 1953 season conditions along the Sacramento River with those of previous years, the following tabulation gives the seasonal accretions, July through September, in per cent of simultaneous diversions. This tabulation, in part, is excerpted from Table 147 in the 1946 Water Supervision report. Since 1947 these figures were derived from the summation data in Table 2 in each report, but under the same provisions detailed in the "note" under Table 150 in the 1946 Water Supervision report, except that additional tributary streams have been excluded from the unmeasured accretions and the method of computing the flow of the Sacramento River at Sacramento has been changed as detailed under "Notes on Certain Gaging Stations". These changes in computation procedure will not affect the comparative figures in the following tabulation more than five per cent because the contribution from the tributary creeks is a small percentage of the total accretions during the summer months.

Since 1947 the accretions used in computing the comparative accretions in per cent of diversion figures were obtained by taking the total unmeasured accretions, Red Bluff to Sacramento, from Table 2 in each report and adding to this total the measured flow in the definite return flow channels of Reclamation Districts 70, 108, 787, 1000, 1500, and the return flow of Colusa Basin Drain including Knights Landing Ridge Cut and Sycamore Slough.

Comparative Seasonal Accretion Percentages - 1938-1953

Sacramento River - Red Bluff to Sacramento

Year	Seasonal Runoff at Red Bluff in per cent of 60-year Normal	Accretions in per cent of Diversions* July through September
1938	169	64

*Excludes City of Sacramento municipal.

It is apparent from the above tabulations that there are variations in the accretion percentages with relation to the seasonal runoffs. However, a definite trend in this relation indicates that summer accretions to stream flow on the Sacramento Valley floor are influenced not only by return water from irrigation but also by natural ground water seepage. Ground water seepage, as indicated by the above accretion ratio, is observed to be accelerated during those summer seasons which follow late and abundant spring rains on the valley floor.

San Joaquin Valley Accretions. The summer and fall season stream flows in the lower San Joaquin River and its tributaries on the valley floor consist mainly of accrete flows derived to a large extent, from irrigation water returning to the stream channels by way of percolation to the ground water and ground water seepage to the channels. The exceptions to this condition are on the Tuolumne and Stanislaus Rivers when irregular releases for power generation below upstream diversion points further augment the flows.

The channels of the Stanislaus, Tuolumne, and Merced Rivers in their Westward flow across the valley floor from the foothills are in deep degraded canyons between more or less sheer bluffs rising from 10 to 50 feet to the predominant level of the upper plains of the valley floor. The plains areas are intensively irrigated with regulated gravity water supplies derived from the upper reaches of the same streams. Thus, an abundant water supply in normal years, a deep and permeable soil and the deep river channels are all conducive to relatively steep slopes of the ground water table toward the rivers and the consequent high rate per mile of accretions to the stream flow.

The channel of the San Joaquin River between Friant and the valley trough near Mendota passes through the plains area in a deeply degraded canyon 10 feet to 100 feet deep between relatively sheer bluffs. The plains area along the south side of this reach

is intensively irrigated with Kings River water through the Fresno Irrigation District distribution system. On the plains along the north side of this reach in Madera County, irrigation water is derived mainly from ground water, except where occasional parcels are served with pumped river water and other parcels receive gravity supplies from Fresno River. In general the elevation of the ground water plane on the south side of the San Joaquin River is above the river bed and along the north side it is below the bed. Consequently, there are accretions from the south and losses to the north along this reach of the San Joaquin River.

The magnitude and importance of these accrete waters in the San Joaquin Valley as a water supply is brought out in Table 3. There does not appear to be as definite a relation of accretions with respect to diversions along these San Joaquin Valley streams as exists in the Sacramento Valley. This lack of a relation may be due, (1) to the considerable lag between the time diversions are made from the streams for storage in terminal reservoirs (Woodward, Dallas-Warner, and Owens) and the time a portion of those waters return to the stream channels after having been applied for irrigation, and (2) to the prevailing climatic effects upon rainfall, humidity, transpiration, and evaporation.

The ratio of accretion (including return water from irrigation) to diversions along the lower San Joaquin River and its tributaries, Stanislaus, Tuolumne, and Merced Rivers, is considerably smaller than that for the Sacramento River. Analysis of pertinent data in Table 3 and comparison with the data contained in Table 147 of the 1946 Water Supervision report indicate this San Joaquin Valley ratio to vary between 19 and 35 per cent while the foregoing table shows the Sacramento Valley ratio to vary between 36 and 64 per cent. This difference may be attributed to the fact that, whereas, due to basin topography and geology, practically all drainage from Sacramento River diversions is quickly returned to the river, considerable return water in the San Joaquin Valley may never reach the surface streams because it percolates to ground water and is recovered by drainage and deep well pumps in the areas of many of the irrigation districts for re-use through the irrigation canals.

The Tule River debouches onto the valley floor in the vicinity of Porterville through a shallow meandering channel. The bed of the channel as it crosses the valley floor is made up of unconsolidated sediments with high permeability. This latter fact accounts for the heavy channel losses along Tule River as shown in Table 4.

Stream Flow Measurements

Many of the stream gaging stations, the records from which are reported herein, are maintained, operated, and rated, and the flows at them are computed, by agencies cooperating with the work of the Sacramento-San Joaquin Water Supervision. The methods used by all cooperating parties are standardized and the results obtained are equally good. In order to obtain uniformity, however, the Water Supervision engineers cooperate with the other agencies in obtaining and correlating the records for each of the cooperative stations.

During the 1953 season, 67 of the total of 155 gaging stations on streams and drainage channels for which records are reported herein were maintained, operated and rated, and the flows at them were computed, solely by the Division of Water Resources through Water Supervision, Flood Control, and other functions.

An automatic water stage recorder is in operation at each of the gaging stations used in this work. The continuous records of water surface elevations at the stations serve two major purposes in the preparation of the data presented in this report. First, the actual surface elevations at two adjacent stations on a stream afford the means of obtaining the water surface elevations at the pumping plants along the stream between those stations. These elevations give the pumping heads, which heads, in turn, become factors in determining the rates of diversion by the pumping plants. Second, the water surface elevation (gage height) is a factor in determining the flow of the stream, in second-feet, passing the station.

A stream-flow rating is made for each gaging station. This rating gives the flow in second-feet for each gage height at the station. Normally this gage height-flow relation, or rating, is more or less permanent where there is a fixed channel and a fixed flow regimen at the station. The rating varies however where the bed of the channel is of loose shifting sand, or heavy weed growth accumulates as the season progresses, or where there may be back water effects from downstream conditions. In this latter case, more frequent measurements of flow are made to obtain accurate records of the flows passing the stations.

Water surface elevations at any time at certain gaging stations may be derived by the reader by using Table 6 coupled with the appropriate stream flow data in Tables 9 through 164. From the stream flow table the flow on any desired day is interpolated into the specific station's rating table in Table 6 to give a gage height (or elevation) of the stream's water surface for that day.

Preliminary Data from Cooperating Agencies

Some of the stream flow records submitted by cooperating agencies and included in this report must be considered "Preliminary Data" since this report is published prior to final preparation of the data for publication by those agencies. This condition is particularly true with respect to some data furnished by the U. S. Geological Survey.

Stream Flow Bulletins

During 1953, stream flow bulletins were compiled from time to time and mailed to interested agencies and persons. The bulletins listed the results of stream flow current meter measurements made along the Sacramento and San Joaquin River system on the valley floor by Division of Water Resources (Sacramento-San Joaquin Water Supervision) and U. S. Geological Survey engineers.

Notes on Certain Gaging Stations

Records are obtained and published in this report for 155 gaging stations in the Sacramento and San Joaquin Valleys, including two stations not heretofore published

in this series of reports. A brief description of each station is given at the bottom of the stream flow data table. The location of each station is shown on Plate 3 in the pocket on the back cover of this report. Notes on the newly included stations, together with a repetition of notes on the Sacramento River at Sacramento, are believed desirable, however, for a better understanding of the records. These notes are as follows:

Sacramento River at Sacramento. The method of computing daily mean flows at this station, beginning with 1947, has been radically changed. Heretofore, as shown in reports prior to 1947, the low flows which are affected by tidal action, were derived from (1) the records of flows at Verona on the Sacramento River and at H Street Bridge on the American River and (2) records of diversions from and drainage to the rivers between those two upper stations and the I Street Bridge at Sacramento. The method previously used did not take into account unmeasured accretions or losses in the reach between Verona and I Street Bridge and in the American River below H Street.

Since 1947, rating of the I Street Bridge gaging station and the computations of daily mean Sacramento River flows passing Sacramento have been made by the slope-velocity method. This method requires a consideration of the gage heights recorded at the river gaging station at Snodgrass Slough (20 miles downstream from Sacramento) as well as the recorded gage heights at Sacramento.

The final relation for tidal influenced flow conditions at Sacramento involves the construction of a rating curve having as the ordinate the difference between the gage heights at Sacramento and at Snodgrass Slough and as the abscissa a function of velocity (fV) equalling the measured discharge in second-feet divided by the gage height at Sacramento. Flows, in second-feet, passing Sacramento are obtained from this relation by multiplying the scale value of fV for any particular differential gage height, by the corresponding gage height at the I Street recorder. This relation is used for gage heights at Sacramento less than 10.5 feet (a flow of 33,000 second-feet) below which tidal fluctuations are effective. Tidal fluctuations cease above the 10.5-foot stage and the regular stage-discharge rating is used for these higher flows.

During 1952, an investigation of the tidal-affected flow of the Sacramento River at Sacramento was undertaken under a cooperative agreement by the Division of Water Resources, the U. S. Bureau of Reclamation, and the U. S. Geological Survey. Principal features of the investigation were the continuous measurement of discharge at the Sacramento station throughout a 14-day tidal period, the operation of a recording current meter and a recording deflection meter as aids in studying the affect of tidal forces, and the making of additional tidal cycle measurements during the tidal flow period. Particular attention was also given to the rating of the upstream gaging stations to assure that these records were entirely dependable. Studies by the U. S. Geological Survey of the data gathered during 1952 indicated that improvements could be made on the present method of rating, particularly during periods of mean flow at Sacramento below 10,000 second-feet and that the field investigation should be continued. Consequently, during 1953, a program of

measurements was scheduled to augment the findings of the 1952 investigation. As a result of these cooperative efforts, a more accurate means of rating the tidal-affected flows at Sacramento was under study by the U. S. Geological Survey at the time of publication of this report.

Discontinued Stations. The flow records of five stream flow stations were discontinued in 1953. The record of Feather River below Yuba River was discontinued in January, 1953. The record at Lone Tree Creek near Valley Home was discontinued on May 26, 1953. The records at Panoche Creek near Panoche, San Luis Creek near Los Banos, and White River near Ducor were each discontinued on September 30, 1953.

The records of five stream flow stations were discontinued in 1952 and are not included in this report. These stations were Sacramento River at Redding, Sacramento River at Balls Ferry, Colusa Trough (Back Borrow Pit) near College City, Putah Creek at Liberty Island Road, and Tule River above Little Pioneer Ditch.

Additional Stations Reported in 1953. The daily diversions from the Sacramento-San Joaquin Delta to the Delta-Mendota Canal at Tracy Pumping Plant and to the Contra Costa Canal at Pumping Plant No. 1 have been included in this report in Tables 163 and 164. Previous reports have included only the monthly diversion quantities. Data on these diversions are supplied by the U. S. Bureau of Reclamation.

Precipitation

In the Central Valley of California, direct precipitation is a negligible source of water supply for growing crops during the late spring, summer, and fall seasons. During the early irrigating season, however, the attendant cooler temperatures and higher humidities of rain storms substantially reduce the demand for irrigation diversions, and are two of the main factors affecting the variations in demand in the same month from year to year.

The following tabulation gives the 1953 precipitation by months at representative valley floor rainfall stations and the normals based on 30 years of record from 1920 to 1952. Records are from the U. S. Weather Bureau.

Station		Inches in Precipitation - 1953												
		Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Annual
Red Bluff	- 1953	3.56	.26	.55	4.24	1.29	1.13	0.00	0.10	0.00	.58	3.11	.96	15.28

Merced	- 1953	1.23	.04	.68	1.47	.26	.33	0.00	.00	.00	.09	1.93	1.03	7.06
	- normal	2.23	1.87	1.86	1.00	.49	.10	.01	.02	.17	.51	1.20	1.80	11.26
Fresno	- 1953	1.49	.09	.59	.96	.48	.32	T	T	.00	.18	1.51	.51	6.13
	- normal	1.57	1.66	1.63	.96	.28	.11	.01	.00	.05	.66	.75	1.63	9.31

Analysis of the above data show that the Central Valley floor precipitation averaged 67 per cent of normal for the 1953 calendar year.

USE OF WATER FOR IRRIGATION

The prevailing warm temperatures and a prolonged frost-fee period during the summer season in the Sacramento and San Joaquin Valleys favors the profitable production of a wide variety of marketable crops in large quantities. The availability of irrigation water during the dry summer season affords continuous growing conditions necessary for the many crops.

The major irrigated crops in the Sacramento Valley include rice, alfalfa and clover, citrus and orchard fruits, nuts, grapes, hops, truck crops, and field crops; in the Delta area they include alfalfa, orchard fruits, corn and truck crops; and in the San Joaquin River and tributaries service area they include grapes, nuts, orchard fruits, cotton, alfalfa and clover, truck crops, corn, grain, flax, and pasture.

Irrigation Diversions

Measurements and records of diversions in 1953 have included all of the points of diversion on the valley floor along the Sacramento River and its tributaries; along the Cosumnes, Mokelumne, and Calaveras Rivers; along the upland banks of the delta channels of Old San Joaquin River, Tom Paine Slough, and San Joaquin River; along the Stanislaus, Tuolumne, and Merced Rivers and Dry Creek tributary to Tuolumne River; along the San Joaquin River between Friant Dam and Durham Ferry Bridge (Vernalis); along Fresno Slough and Fresno Slough By-Pass; and along Tule River.

This report contains records of a total of 1,256 points of diversion segregated by sources as follows: Sacramento River 338, Colusa Trough (above Colusa-Williams Highway Crossing) 35, Back Borrow Pit (extension of Colusa Trough along back levees of Reclamation Districts 108 and 787) 41, Knights Landing Ridge Cut 8, Yolo By-Pass 6, Cache Slough 2, Lower Butte Creek and Butte Slough 37, Sutter By-Pass and Sacramento Slough 65, Feather River 45, Yuba River 13, Bear River 4, American River 21, Cosumnes River 27, Mokelumne River 75, Calaveras River (including Mormon Slough) 122, Tom Paine Slough 8, Old San Joaquin River (between Vernalis gaging station and Fremont Ford Bridge) 41, San Joaquin River (between Fremont Ford Bridge and Friant Dam) 96, Fresno Slough and Fresno Slough By-Pass 4, Merced River 81, Tuolumne River 43, Dry Creek (tributary to Tuolumne River) 12, Stanislaus River 36, and Tule River 12. The locations of these points of diversion are shown on Plate 3 in the pocket at the back of this report.

All of the diversions, except 76 by gravity, are accomplished by pumping. The records of diversion by gravity are obtained by means of canal ratings established by flow measurements. In the case of pumping diversions, there are a few instances where the records are obtained by means of canal ratings, but, in the main, the records are obtained from a relation established between electric power consumption, static head and

plant efficiency. This is made possible by the fact that nearly all of the pumping plants are electrically operated. The relation between water pumped and power input is determined from current meter or flow meter measurements of the discharge and the measured kilowatt input. At the larger pumping plants, several measurements are made during each season. At the smaller plants, a number of measurements are made initially to determine the ratings and thereafter measurements are made at intervals to discover any changes which may occur in the ratings. Due to intermittent operation of the smaller plants and the large area to be covered by the field engineers, it is not possible to make many discharge measurements at any one of them. However, it is believed that the rating, as initially determined, remains more or less constant and that over a period of time enough measurements are secured to determine any change in the rating. All rating measurements made by owners or cooperating agencies have been given full consideration in the final computations of the amounts of water diverted by each individual plant.

Prior to 1933, a daily diversion record for each plant was compiled. However, since that year, except for some of the larger plants, the monthly diversion records only are available. The diversions for 1953 have been computed on a monthly basis only, and the breakdown into daily records was not made. The monthly amounts of water diverted at the individual points of diversion along all of the streams covered by the Water Supervision work are given in Tables 165 through 192.

The monthly amounts of diversions in acre-feet by the large east-side irrigation districts from the Stanislaus, Tuolumne, and Merced Rivers during 1953 are shown at the end of Tables 188, 189, and 191. The monthly diversions in acre-feet into the Friant-Kern and Madera Canals from Friant Reservoir on the upper San Joaquin River are set forth in Table 186 and those into the Delta-Mendota and Contra Costa Canals from the Sacramento-San Joaquin Delta in Table 181. The daily diversions to the Delta-Mendota and Contra Costa Canals are set forth in Tables 163 and 164. The monthly deliveries in acre-feet from the Main Canals of the Central Valley Project to the various water users along those canals are presented in Table 193.

Fresno Slough and James By-Pass normally convey excess Kings River water flood flows into the San Joaquin River at a point above Mendota Dam, but during the irrigation season, San Joaquin River water is backed up through those channels by the Mendota Dam to afford irrigation supplies to the James and Tranquillity Irrigation Districts and to certain other diverters. The diversion and irrigated acreage data for these streams shown in Table 187 were furnished by the U. S. Bureau of Reclamation.

Table 171 presents the diversions by Reclamation District 2068 and the City of Vallejo from Cache Slough during 1953. Diversions by the City of Vallejo started in April, 1953. The irrigated area in Reclamation District 2068 lies outside of the established boundary of the Delta shown on Plates 3 and 4 and can be classed as a "Delta Uplands" area. The purpose of including Table 171 in this 1953 report is to present as full a record as

is available of the use of water in and from the Delta, in conjunction with the Delta crop survey data in Table 198 of the 1950 Water Supervision report.

A seasonal summary of water utilization during the past ten years, 1943 through 1952, from the Sacramento River and its tributaries and the San Joaquin River and its tributaries as compared with the 1953 summary is shown in Table 165. This table presents an overall picture of the water utilization in these areas.

In Table 194 there are shown the average monthly diversions in per cent of the seasonal for the streams in the Sacramento and San Joaquin Valleys. A summary of the monthly diversions from the Sacramento and San Joaquin valley streams for the eleven-year period, 1943 through 1953, is given in Tables 195 through 205. Table 206 shows, for the Sacramento River only, the seasonal diversions and acreages irrigated for the period 1943 through 1953, segregated to the different river sections.

Irrigated Acreage

Toward the end of the irrigating season in 1953, as was done in previous years, a complete canvass was made of acreages irrigated from each of the points of diversion covered by the Water Supervision work. The irrigated acreages for all of the points of diversion on the streams on the Sacramento and San Joaquin valley floors were plotted on suitable maps and are retained on file in the office of the Division of Water Resources for record.

The area irrigated through each individual point of diversion along the streams covered in this work is given in Tables 166 to 192 inclusive. These tabulations and the associated summarizing tables do not include data on diversions and use of water in the Delta.

The following is a summary of the total acreage irrigated during 1953 in the area covered by the Water Supervision work as shown in Table 5. This tabulation, as noted in the footnotes of Table 5, does not include the acreage of the large east-side irrigation districts in the lower San Joaquin Valley, nor does it include the acreage served by the Friant-Kern, Madera, and Delta-Mendota Canals. Detailed acreage tabulations of the totals shown below, as well as those of the large irrigation districts mentioned, may be found in Tables 165 through 192 and in Table 198 (Delta Crop Survey) of the 1950 Water Supervision report.

Area	1953 Irrigated Acreage	
Sacramento Valley Floor above Sacramento	468,374	
San Joaquin Valley Floor above Delta	393,383	
Delta Uplands and Tributaries	112,981	
Total area served by measured diversions		974,738
Sacramento-San Joaquin Delta - 1950 Survey		
Cropped	365,800	
Water Consuming - not cropped	82,500	
Total Delta		448,300
Grand Total		1,423,038

Table 207 shows a comparison of the acreage of rice irrigated during the period 1924 through 1953 from the stream channels within the Sacramento and San Joaquin Valleys which are covered by Water Supervision work, and the total acreage of rice in California irrigated from all sources as reported by the Federal-State Crop Reporting Service.

In view of the methods of farming, which usually employ rotation of crops with summer-fallow, it is probable that the acreage of land under irrigation facilities in the area covered by the Water Supervision activities excluding the large east-side irrigation districts and the areas served by the Central Valley Project Canals exceeds 1,500,000 acres.

1950 Sacramento-San Joaquin Delta Crop Survey

A complete survey of the acreages of crops, including both irrigated and non-irrigated, in the Sacramento-San Joaquin Delta was made during November and December of 1950 and January and February of 1951, as called for in the State-Federal contract described in the "Foreword" of this report. The crop segregations were plotted on a series of suitable maps of the Delta islands which are on file with the Division of Water Resources. Similar surveys of the Delta area had been made previously, the last one in 1948. All of the 1950 Delta acreage data are tabulated in Table 198 to be found in the pocket on the back cover of the 1950 Water Supervision report. That table gives the acreage of each cultivated or uncultivated crop segregated by tracts and islands.

The total water consuming area of the Delta is segregated for 1950 as follows:

Total irrigated cultivated crops, not including double- or inter-crops	365,800 acres
Total idle lands below 5.0 feet in elevation, including interior water surfaces	42,900 acres
Total exterior channel water surfaces	37,600 acres
Small islands (est.)	300 acres
Total brush and trees in exterior channels (est.)	1,700 acres
Total water consuming area, 1950	448,300 acres

These data are similar and are comparable to data in Table 148 of the 1948 Water Supervision report.

Use of Water in Delta

Previous Water Supervision annual reports have included considerable analyses of the utilization of water in the Sacramento-San Joaquin Delta. The work of Water Supervision does not cover the delta area to the extent of measuring flows in the numerous interconnected channels or quantities of water diverted for irrigation, other occasional special studies, but periodically, surveys have been made of crops and irrigated acreages. Special investigations of the Delta irrigation problems have been conducted and the results therefrom have been reported in previous reports.

In some previous reports, for years in which crop surveys were made, the total consumptive use of water has been segregated to show the use in each river delta. There was also shown a classification of the irrigated crops with respect to the peat and sedimentary soils on which they were produced.

Gross Duty of Water

The term "gross duty of water", as used in this report, is defined as being the total amount of water diverted to serve one acre of irrigated land. The gross duty for any particular period may be expressed as the amount of water diverted in acre-feet per acre irrigated, or, conversely stated, may be expressed as the number of acres irrigated per one second-foot average diversion rate. The gross duty of water does not include solely the net amount of water consumed by plants in their processes of transpiration and growth, but also includes all irrecoverable losses through evaporation and deep percolation, plus canal and conveyance losses, and those amounts of water which act as a necessary vehicle to carry irrigation heads across porous soils or to maintain fresh water ponds in the growing of rice and which return to some river or drainage channel, with little loss, to become available for re-use.

Gross duty of water figures for the individual stream channels covered by Water Supervision work are given for the Sacramento and San Joaquin Valleys in Table 165.

SALINITY INVESTIGATIONS

The intrusion of salty water from San Francisco Bay into the channels of the Delta from which irrigation supplies are derived, is a matter of extreme importance and the Water Supervision work, with cooperation from the U. S. Bureau of Reclamation, has included observations during 1953 of the saline content of the water at several stations throughout the Delta and upper San Francisco and Suisun Bay areas.

Purpose

The purpose of the salinity investigation, as outlined in previous reports, has been to record the occurrence and extent of salinity encroachment from San Francisco Bay, and to establish the relation between movement of salinity, stream flow to the Delta, and tidal action. As reported in Bulletin 27 of the Division of Water Resources, this relation was established for the conditions which obtained during the period of the special investigation for that bulletin and upon the basis of all data available at that time. Subsequent investigations, therefore, have been directed to the maintenance of an unbroken record of the salinity, tidal and stream flow variations, essential not only in the corroboration of the relation presently established, but as the basis for a check of possible modifications attributable to changes in channel and tidal conditions which may have taken place or will occur in the future. Also, during periods of low stream flow, the continuation of salinity sampling has been essential in keeping the Delta irrigators advised of conditions through periodic bulletins so that damage from the use of water of too high salt content might be averted. (A chloride ion concentration of 1000 parts of chloride per million is

commonly used as an average criterion beyond which usefulness of water for irrigation is limited).

During 1953 the continuous observations of salinity served as an important factor in determining the amounts of release from Shasta Reservoir as controlled by the U. S. Bureau of Reclamation.

Scope

The general scope of this investigation each season has been such as to insure that samples of water to be tested for salinity could be taken at regular intervals at a sufficient number of stations throughout the Delta and upper Bay region so that the advance and retreat of the salinity from early summer to late fall would be completely recorded. Plate 4 shows the limit of encroachment into the Delta of water having 1000 parts of chloride per million parts of water for the years 1931, 1938, 1952, and 1953. These certain years are chosen to show the maximum and minimum seasonal limits of encroachment for conditions prior to the commencement of releases from Shasta Reservoir, to wit, 31 per cent of normal runoff during 1931, 172 per cent of normal runoff during 1938. The salinity encroachment lines for each of the years 1920 through 1944, may be found on the Delta map, Plate 5 in the 1944 annual Water Supervision report, and for each of the years 1945 through 1951 on the Delta map, Plate 4 in the 1951 or 1952 Water Supervision report.

The curtailment of appropriations to the Division of Water Resources by the Legislature in the 1941-1942 budget resulted in the suspension of the salinity sampling program at all stations in the Bay and Delta areas on July 15, 1941. Through cooperation of the Fontana Farms Company, the City of Antioch Water Department, the U. S. Bureau of Reclamation, the Dow Chemical Company at Pittsburg, and the City of San Francisco, miscellaneous samples were taken during the 1943 season and the results of the analyses are presented in the 1943 report of Water Supervision. In that same report, there are tabulated a large number of complete analyses of water from the channels of the Sacramento and San Joaquin Valleys and the Delta as prepared by the U. S. Bureau of Reclamation.

A regular program of salinity sampling and testing was re-established early in 1944 as part of the activities of the Sacramento-San Joaquin Water Supervision, with the necessary funds therefor being provided by the U. S. Bureau of Reclamation under a cooperative contract. This regular program was continued throughout 1953. The records of water samples taken during 1953 from the active sampling stations are given in Table 211. A description of the location of each of these stations is contained in Table 210. Descriptions of inactive stations are not included in Table 210 but can be found in previous reports.

Prior to 1952, the salinity values were reported in the Water Supervision reports as the number of parts of chloride per 100,000 parts of water. Beginning with the 1952 report, the salinity values are reported as parts per million to be consistent with the analyses presented in other tabulations.

Station Maintenance and Records

The salinity sampling at all stations is performed by local observers. Each observer is provided with a schedule showing the exact time for taking the samples, so that, throughout the Delta and upper bays all samples are taken at four-day intervals approximately one and one-half hours after the same high tide.

The observers are furnished with stamped containers for the sample bottles which can be mailed, as filled, to the laboratory at Sacramento. Analyses of the water during the 1953 season were made at the Materials and Research Laboratory of the Division of Highways in Sacramento before July 1 and at the Water Quality Laboratory of the Division of Water Resources in Bryte after July 1.

The maximum salinity as recorded at the stations in 1953 is shown in Table 208. For comparative purposes, this table shows also the maximum salinity recorded at these stations in representative years before and after Shasta Reservoir operation. Only presently indicative and active stations are included in this comparison.

Salinity Bulletins

During 1953 a salinity bulletin was mailed each month to many cooperating agencies and individuals giving the results of samples taken and analyzed at four-day intervals at all stations. The figures given were the laboratory determination of the number of parts of chloride per million parts of water.

Area of Salinity Encroachment

There is an apparent relation between the average stream flow to the Delta during the ten-day period of minimum flow and the area affected by salinity encroachment. Data amassed in this regard indicate that when the flow to the Delta drops below a certain amount the rate of advance of salinity encroachment greatly accelerates. A comparison of the average stream flows during the ten-day period of minimum flow and the affected acreage in the Delta is presented in Table 209. An area of approximately 4,480 acres within the boundary of the Delta was affected by salinity encroachment of 1000 parts of chloride per million parts of water in 1953.

Complete or Partial Analyses of Surface Flows

As a matter of record, there is included in this report a tabulation of the results of complete or partial chemical analyses of samples of water taken at many points along the Sacramento and San Joaquin Rivers and in the Delta during 1953. These results are contained in Tables 212 and 213. The results in Table 212 were furnished entirely by the U. S. Bureau of Reclamation. The results in Table 213 were furnished by the Water Quality function of the Division of Water Resources. The complete analyses reported in Table 213 were analyzed by the U. S. Geological Survey Laboratory under a cooperative agreement with the Division of Water Resources and must be considered as "preliminary data, subject to revision". The methods of collecting and analyzing these samples are appreciably

different and more complex than the methods employed in determining the chloride component as part of the regular salinity observation activities in the Sacramento-San Joaquin Delta.

TIDE GAGES

The 28 recording tide gages located on the Delta channels and on the upper bays were continued during 1953. Previous Water Supervision reports contained detailed descriptions and locations of the gages. The Flood Control unit of the Division of Water Resources operates and maintains 18 of these tide gages. The remaining 10 are operated by Federal agencies.

DELTA OUTFLOW MEASUREMENTS

During September, 1953, a series of tidal-cycle current-meter measurements utilizing new methods and techniques were made simultaneously on both the Sacramento River about four miles above and the San Joaquin River about seven miles above their confluence. The purpose of the measurements was to determine accurately the actual amounts of fresh-water outflow from the Sacramento-San Joaquin Delta into Suisun Bay which act to control and counteract the natural intrusion of saline sea-water from the bays into the Delta area. The results of such measurements are essential basic data for studies of salinity control and water availability in the Delta. Previous measurements made for this purpose gave inconclusive results because of the employment of conventional methods which were proved inadequate under the adverse hydrographic conditions encountered.

The Water Supervision function of the Division of Water Resources performed the flow measurements with funds supplied by the Water Project Authority of the State of California. Members of the staff of the Water Project Authority participated in the actual field work and contributed to the development of the new procedural techniques involved. The Water Quality function of the Division of Water Resources with personnel assistance from the U. S. Bureau of Reclamation observed the variations in salinity during the flow measurements by sampling and by recording salinity meters. Under a contract with the Division of Water Resources the Corps of Engineers, U. S. Army, furnished and manned the two steel tug boats used for the measurements. The Surface Water Branch of the U. S. Geological Survey assisted with technical advice. The Water Quality Branch of the U. S. Geological Survey, under a cooperative arrangement with the Division of Water Resources, provided results of water analyses of samples collected during the measurement.

The conventional method of determining the flows in tidal-affected streams involved the suspension of the current meter at a series of fixed points from either a bridge or from a boat anchored to a tag-line. It was necessary to modify that method in order to avoid the inaccuracies in measuring the slow and indeterminable direction of velocities before and after slack-water periods, and to avoid the errors induced in the current-meter observations due to the pitch and roll of an anchored boat. In this series of measurements

the new method consists, basically, of moving the current meter through the water by a free moving boat at a constant velocity over a measured distance parallel to the thread of the stream. The true water velocity with respect to the shore is equal to the velocity of the boat with respect to the water minus the velocity of the boat with respect to the shore. This method was proposed by the staff of the Water Project Authority and was adopted after consultation with the U. S. Geological Survey and after actual trial comparison tests were made between the new moving-boat method and the heretofore accepted conventional method.

A survey of the channel bottom at the selected sites on the Sacramento River at Mayberry Slough and on the San Joaquin River below Antioch Bridge was made using sonic echo sounding equipment mounted on a boat furnished under a cooperative arrangement by the U. S. Bureau of Reclamation. A contour map of the channel bottom at each site was then prepared and the most uniform reach, 150 feet in length along the channel, was selected. Locations of the points at which velocities were to be measured were determined from a study of the average cross section of the selected reach. Each of the measuring points across the channel was located in the field by triangulation and accurately sounded with cable and weight equipment. Tables were then prepared showing depth and settings of current meters at each of the sections for water surface elevations throughout the tidal range.

Two 45-foot tugs were rented under contract from the U. S. Corps of Engineers, San Francisco District, for the two simultaneous measurements. Measurements were started at 4 p.m. on September 14 and continued uninterruptedly until 10 a.m. on September 17, 1953. The hydrographic crew consisted of 32 men including boat operators, meter men, note keepers, range men and crew chiefs. These men were organized into two shifts at each of the measuring sites and worked on 8-hours-on and 8-hours-off basis. The Army tugs were rigged with reels and booms to suspend two current meters, one each over the port and starboard bows. Range lines consisting of parallel lines 150 feet apart perpendicular to the channel at the ends of the selected reaches were identified on each bank by colored flags and lights. A transit was set up on each of the range lines and sighted on the far bank range marker. Velocities were measured at 11 sections across the Sacramento River and 13 sections across the San Joaquin River. The sections were marked by colored and lighted buoys on the Sacramento River and by flagging and lighting specific piers of the Antioch Bridge at the San Joaquin River site. The boat and shore crews coordinated their activities by means of two-way radio communication. The meters in the boats were positioned to the 0.2 and 0.8 depths at each of the sections across the channel from the predetermined depths. Local gages established at each site afforded a means of keeping a constant check on water surface elevations. Measurements at each of the sections were made with the boat moving against the current at a constant speed perpendicular to the range lines with the current meters correctly positioned. The actual velocity of the boat with respect to the shore as determined by clocking it between the range lines with stopwatches was then subtracted from the differential velocity between the boat and the water as determined by the current meter measurements to compute the actual velocity of the water. The average time required

to make one complete measurement across the channel, (including time for salinity observations which were carried on concurrently), was approximately one hour. The width of the Sacramento and San Joaquin River measuring sections were approximately 2,540 feet and 3,370 feet, respectively. Depths ranged down to 40 feet. Velocities varied between 0 to 2½ feet per second. Flows moved in both upstream and downstream directions varying from zero to as much as 152,000 second-feet in the San Joaquin River section and as much as 106,000 second-feet in the Sacramento River section.

Upon completion of the tidal-cycle measurement, the field data was compiled, plotted and analyzed by the staff of the Water Project Authority. From the current-meter observations, the water velocity and direction were determined. In previous tidal-cycle measurements made by the Division of Water Resources, the usual procedure was to plot a weighted mean flow for each complete measurement across the channel. A new technique was devised for this measurement in that each section was considered as a separate stream channel. For each section the flow was plotted at the exact time the current-meter observation was made. These points were connected by straight lines resulting in a hydrograph of each section which showed the variations in the flow between measurements. A final hydrograph of the flow in each stream was then compiled by adding algebraically, from each section's hydrograph, the instantaneous flow at each section every hour. A point on the final hydrograph indicated the total flow for the channel at that particular instant as though each of the sections across the entire river had been measured simultaneously. An important factor in the determination of the outflow from the Delta was the change of tidal volume during each tidal-cycle phase. Gage heights from 31 recorders in the Delta area were compiled and a water surface area was assigned to each water stage recorder. From these the change in Delta volume between any two periods of time was calculated.

Various methods were tried in the analysis of the data to determine the net outflow from the Delta. The method finally adopted was to calculate the net outflow between times of equal Delta volumes. The net outflow as computed by this method varied from 6,900 second-feet to 24,600 second-feet during periods of equal tidal volumes with an average for the measurement period of 16,500 second-feet. The range in rate of outflow during the 60-hour period indicated that there were variations in the outflow throughout a lunar cycle which should be taken into account before the average net outflow from the Delta could be determined, and that the measurements of outflow should be extended over a period of at least 14 days. Since the method and techniques involved in making this 60-hour measurement proved satisfactory, it was concluded that at least one 14-day measurement would be made during 1954.

NR No record.
(a) Not included in inventory or totals.
(b) Deliveries from Delta Mendota Canal to Mendota Pool as computed by U. S. Bureau of Reclamation.
(c) Includes diversions from Fresno Slough and James By-Pass.
(d) Includes diversions from Merced River below Stevinson.
(e) Includes diversions from Tuolumne River below Tuolumne City.
(f) Includes diversions from Stanislaus River below Mile 2.9.
(g) Includes diversions from Dry Creek below Gaging Station (near Modesto).

These quantities are the daily mean second-feet inflow to Shasta Lake as computed by taking a summation of the change in storage, release, spill, precipitation, and evaporation and are representative of the natural flow passing the dam site if the dam had not been constructed. Drainage area is 6665 square miles. Records for 1953 computed by U. S. Bureau of Reclamation.

(a) 23-hour day.

(b) 25-hour day.

Station is maintained jointly by the Division of Water Resources and the U. S. Geological Survey. Station is located at Mile 62.9 above Sacramento, 0.3 of a mile below Wilkins Slough pumping plant of Reclamation District 108, and 1.3 miles below Tisdale Weir. Period of record 1931 to date. Records for 1953 computed by U. S. Geological Survey.

Station is maintained jointly by the Division of Water Resources and the U. S. Geological Survey. It is located at the Knights Landing Railroad Bridge, Mile 34.0 above Sacramento, below the point of discharge to the river of Colusa Basin drainage via the Back Borrow Pit of Reclamation Districts 108 and 787. Period of record 1921 to date. Records for 1953 computed by U. S. Geological Survey.

Station is maintained jointly by the Division of Water Resources and the U. S. Geological Survey. It is located at Mile 19.6 above Sacramento at the mouth of "Natomas Cross Canal", main drain between Reclamation Districts 1000 and 1001, and below the mouth of the Feather River. Flows are measured below the mouth of Cross Canal. Drainage area is 21400 square miles. Period of record 1926 to date. Records for 1953 computed by U. S. Geological Survey.

Division of Water Resources and U. S. Geological Survey cooperative station located at Mile 0.4 above M Street Bridge. This represents the flow of the Sacramento River past Sacramento (below the City of Sacramento intake) to the Delta. Additional water flows to the Delta via East Borrow Pit of Yolo By-Pass (See Tables 73 and 80). Daily mean flows are computed from newly derived curves which take into account tidal fluctuations during low stages. Period of record 1904, 1905, 1921, 1924 to date. Records for 1953 computed by Division of Water Resources. (See discussion in text.)

U. S. Geological Survey and U. S. Bureau of Reclamation cooperative station located 1.0 mile west of Gerber and 3.5 miles above the mouth. Elder Creek is a west-side tributary to the Sacramento River at Mile 178.5. Drainage area is 142 square miles. Period of record October, 1949, to date. Records for 1953 computed by U. S. Geological Survey.
(Prior records are available at a site approximately 20 miles upstream.)

U. S. Geological Survey and U. S. Army Corps of Engineers cooperative station located about five miles above the mouth and above the Glenn-Colusa Irrigation District canal crossing. The flow to the Sacramento River is cut off during irrigation season by an earth fill installed by Glenn-Colusa Irrigation District to transport water from their main canal across Stony Creek. Stony Creek is a west-side tributary to Sacramento River at Mile 136.3R. Water diverted from Stony Creek by G.C.I.D. in acre-feet amounted to: March 15470, April 21260, May 20740, June 4350, July 502, August 831. September 774, October 947 and November 203. Drainage area is 761 square miles. Period of record 1941 to date. Records for 1953 computed by U. S. Geological Survey.

U. S. Geological Survey and Division of Water Resources cooperative station located 0.8 mile downstream from Little Butte Creek and 7.5 miles east of Chico. Butte Creek is a tributary to Butte Slough 0.6 mile above its junction with the Sacramento River. Flows into the Sacramento River are regulated by gates at the mouth of Butte Slough. (See notes on Tables 41 and 51.) Drainage area of Butte Creek near Chico is 148 square miles and period of record 1930 to date. Records for 1953 computed by U. S. Geological Survey.

This is discharge from Butte Slough to Sacramento River at Mile 84.0L and is measured at and regulated by the gravity culverts at the mouth of the slough. These flows, together with those shown in Tables 51 and 52 are, during the summer months, made up almost entirely of return water from lands irrigated by Feather River diversions. Discharge from the Sacramento to Butte Basin over Moulton and Colusa Weirs is shown in Tables 39 and 40. This is a Division of Water Resources station. Period of record 1924 to date.

This is the drainage from Reclamation District 70 returned to the Sacramento River at Mile 68.8L. This plant discharges both to the Sacramento River and to an irrigation canal as is a combination irrigation and drainage plant. The above flow includes gravity as well as pumped drainage. Period of record 1924 to date. Records for 1953 computed by Division of Water Resources.

Division of Water Resources station located 37.0 miles above the mouth of Back Borrow Pit of Reclamation District 108. This station is also known as Colusa Trough at Highway 20 and Colusa Trough at Tahoe-Ukiah Highway. The flow is return water flowing in the main drain of Reclamation District 2047; it is drainage chiefly from lands irrigated by Glenn-Colusa, Provident, Princeton-Codora-Glenn, Compton-Delevan, Maxwell, and Jacinto Irrigation Districts. Flow reaches Sacramento River, at Mile 34.15R, through the Knights Landing Outfall Gates via Back Borrow Pit, (see Table 48). Period of record 1924 to date.

Knights Landing Ridge Cut diverts water from the Back Borrow Pit of Reclamation District 108, at a point above the outfall gates, into the Yolo By-Pass above Elkhorn. Winter flows are uncontrolled. Summer flows for irrigation are controlled at the outfall gates and at the junction with Yolo By-Pass by weir boards and gates. This is a Division of Water Resources station. Period of record 1933 to date.

* Estimated mean for period.

This is the drainage from Colusa Basin passing down the Back Borrow Pit of Reclamation Districts 108 and 787 and entering the Sacramento River at Mile 34.15R, just above the Knights Landing gaging station. Flows are controlled at the Knights Landing outfall gates and a portion of the flow of the Back Borrow Pit is diverted to the Knights Landing Ridge Cut, (see Table 47). Total flow to Sacramento River is sum of Tables 48 and 49. This is a Division of Water Resources station. Period of record is 1924 to date.

Records sufficient to compute only monthly flows.

This water is discharged from Reclamation District 787 by pumping into Colusa Basin Drain below the outfall gates and is not included in the flow shown in Table 48. Daily distribution of flows are not available since the plant operates on an automatic float switch. See Table 45 for additional drainage from Reclamation District 787. Period of record 1940 to date. Records for 1953 computed by Division of Water Resources.

This is discharge from Butte Slough to Sutter By-Pass. During low flow periods gates at head of slough are regulated (Table 41) which forces water under Long Bridge as shown in this table. Normal summer flows are primarily from Feather River sources. During flood perious Sacramento River water enters Butte Basin above Butte City by bank spill and over Moulton and Colusa weirs. The purpose of the summer regulation is to make water available for use on Sutter By-Pass lands (below Long Bridge) and Butte Slough Irrigation Company in Reclamation District 70. This is a Division of Water Resources station. Period of record 1939 to date.

* Estimated

This is the discharge (measured at Weir #4) to the East Borrow Pit of the Sutter By-Pass at Mile 16.5 (north from Chandler). This flow is made up primarily of Feather River drainage or return flows. This flow and flow from Butte Slough (Table 51) makes up the entire Feather River contribution to the Sutter By-Pass. This is a Division of Water Resources station. Period of record 1939 to date.
* Estimated mean for period.

This is the drainage from Reclamation District 1500 discharged to West Borrow Pit of Sutter By-Pass and thence via Sacramento Slough (in the By-Pass) to Sacramento River, (see Table 54). Drainage is by pumping and gravity. Period of record 1930 to date. Records for 1953 computed by Division of Water Resources.

This is the discharge to the Sacramento River at Mile 21.2L via Sacramento Slough. This is the entire outflow of the Sutter By-Pass area and Reclamation District 1500. During high water periods the slough is entirely submerged as it lies within the By-Pass area. Sharp rises in river elevation will cause zero or negative flow. See Tables 51, 52, 53, and 43, which, when combined, will give the measured flow entering the By-Pass area. This is a Division of Water Resources station. Period of record 1924 to date.

* Estimated

(a) Flooded

Division of Water Resources station located at Yuba City-Marysville (5th St.) Bridge, Mile 28.0 above mouth. Backwater from the Yuba River at times affects the stage-discharger relationship of this station. Period of record 1944 to date. The flows at this station for the period January 1 through July 19, 1953, were estimated by subtracting flow of Yuba River at Marysville from the flow of the Feather River at Shanghai Bend because of the erroneous gage heights obtained from the recorder at the Yuba-Feather river junction prevented the use of the slope-discharge relationship.

Division of Water Resources station located on the right bank at Mile 23.0 above mouth. Station is rated above 30,000 c.f.s. by means of simultaneous measurements of Yuba River and Feather River at Marysville with appropriate time lag between Marysville and Shanghai Bend. Period of record 1944 to date.

U. S. Geological Survey and Division of Water Resources station located approximately 2.5 miles southeast of Bangor and 16 miles above the mouth. Honcut Creek is an east-side tributary to the Feather River at Mile 43.7L. Drainage area is 68.6 square miles. Prior records available at a site eight miles downstream. Period of record 1950 to date. Records for 1953 computed by the U. S. Geological Survey.

This is drainage return to the Sacramento River via the cross canal by pumping and gravity. Period of record 1940 to date. Records for 1953 computed by Division of Water Resources.
(a) Natomas Cross Canal is the main drain between Reclamation Districts 1000 and 1001 and joins the Sacramento River at Mile 19.6L.

This is drainage from Reclamation District 1000 return to Sacramento River by pumping and gravity at Mile 6.85L. Daily distribution of flows are not available since the plant operates automatically on float switch. Additional water was returned to Sacramento River from same district at Mile 2.1L (see Table 74). An undetermined amount of water was also returned to the Sacramento River by the Pritchard Lake Plant at Mile 16.0L. Period of record 1940 to date. Records for 1953 computed by Division of Water Resources.

TABLE 73

FLOW OVER SACRAMENTO WEIR FROM SACRAMENTO RIVER TO YOLO BY-PASS - 1953

This is drainage from Reclamation District 1000 returned to the Sacramento River by pumping at Mile 2.1L. Additional water was returned to the Sacramento River at Mile 6.85L (see Table 72) and an undetermined amount was returned to the Sacramento River from the Pritchard Lake Plant at Mile 16.0L. Period of record 1925 to date. Records for 1953 computed by Division of Water Resources.

U. S. Geological Survey and U. S. Bureau of Reclamation cooperative station located three miles northwest of Capay and two miles upstream from Clear Lake Water Company diversion dam. Cache Creek is a west-side tributary to Yolo By-Pass opposite Mile 7.0 north of Sacramento By-Pass. Drainage area is 1052 square miles. Period of record 1944 to date. Records for 1953 computed by U. S. Geological Survey.

Station is maintained jointly by the Division of Water Resources and the U. S. Geological Survey.• This station is also known as Yolo By-Pass at Elkhorn. The flow of this station is referred to the recorder at the end of the Sacramento By-Pass except during periods of high water when it is referred to the recorder at the Woodland-Elkhorn highway crossing. To get total flow through Yolo By-Pass below Sacramento, combine this flow with the flow in Tables 73 and 84. The flow in this table includes the flows of Cache Creek (Table 79), Knights Landing Ridge Cut (Table 47), and Fremont Weir (Table 50). Period of record 1930 to date. Records for 1953 computed by U. S. Geological Survey.
* Estimated mean for period.

U. S. Geological Survey, U. S. Bureau of Reclamation, and Division of Water Resources cooperative station located on Highway 99 bridge 10.7 miles above the mouth. When flow in main channel reaches 4600 cfs water starts to by-pass station. Figures here given include all overflow. Drainage area is 730 square miles. Period of record 1942 to date. Records for 1953 computed by U. S. Geological Survey.

U. S. Geological Survey, U. S. Bureau of Reclamation, and Division of Water Resources cooperative prior to September 30, 1953. Subsequent to that date station was operated by the Division of Water Resources. The station is located at Sanguinetti Lane bridge near the mouth of the canal. Period of record 1944 to date. Records for 1953 computed by U. S. Geological Survey prior to September 30, and by Division of Water Resources after that date.

* Estimated mean for period.

U. S. Corps of Engineers station located approximately 300 feet downstream from Farmington-Escalon road. Station was moved to this location in June, 1952, from its former location approximately one mile upstream. The flows recorded by this station since June, 1952, include flows entering Littlejohns Creek via the Duck Creek diversion canal. Period of record December, 1945, to date. Records for 1953 computed by U. S. Corps of Engineers.
* Estimated.

Division of Water Resources station located 0.3 mile east of Highway 99, 150 feet downstream from Mariposa Road bridge. Duck Creek is an east-side tributary to the San Joaquin River at Mile 46.1R via French Camp Slough. During high-flow periods Duck Creek water enters Mormon Slough at a point approximately two miles east of the head of the Stockton Diverting Canal. Recorder was moved to Pock Lane approximately 0.5 mile downstream on November 20, 1953. Period of record 1950 to date.
* Estimated.

This is the total mean second-feet flow inflowing to Friant Reservoir as computed by the U. S. Bureau of Reclamation, taking into account change in storage, release, spill and evaporation; and is representative of the natural flow passing the dam site if the dam had not been constructed. Drainage area is 1671 square miles. Records for 1953 computed by U. S. Bureau of Reclamation.
(a) 23-hour day.
(b) 25-hour day.

U. S. Geological Survey and U. S. Bureau of Reclamation cooperative station located at Mile 236.4R and 1.8 miles downstream from Skaggs Bridge. Drainage area is 1805 square miles. This station is at approximately the same location as a former Southern California Edison Company station known as San Joaquin River below Skaggs Bridge for which records are available for the period 1926 through 1938 and October, 1952, to date. Records for 1953 computed by U. S. Geological Survey.

U. S. Geological Survey and Division of Water Resources cooperative station located at Hills Ferry bridge, Mile 123.7 above mouth of San Joaquin River and just below the mouth of the Merced River. Combine flow with Merced River Slough (Table 133) to give total flow passing this point. Drainage area is 9990 square miles. Period of record 1912 to date. Records for 1953 computed by U. S. Geological Survey.

Station is maintained jointly by City of San Francisco (Hetch Hetchy Water Supply). Division of Water Resources, Modesto Irrigation District, and Turlock Irrigation District. Station is at Laird Slough Bridge, Mile 96.05 above mouth of San Joaquin River and five miles above the confluence of the Tuolumne River. High flows by-passing this station through old channel of San Joaquin River are included in this Table. Period of record 1931 to date. Records for 1953 computed by the City of San Francisco.

U. S. Geological Survey and U. S. Bureau of Reclamation cooperative station, also known as Fresno Slough By-Pass and Fresno Slough Cut-off. Station is located below Kerman-San Joaquin highway crossing on James By-Pass 5.8 miles above its confluence with Fresno Slough. James By-Pass enters Fresno Slough at Mile 11.8R above mouth of Fresno Slough. Period of record (including a station operated by King's River Water Association a short distance upstream) 1927 to 1932; 1935 to date. Records for 1953 computed by U. S. Geological Survey.

U. S. Geological Survey, U. S. Bureau of Reclamation, and Division of Water Resources cooperative station, also known as Merced River Slough near Hills Ferry Road Bridge, located 500 feet downstream from the head of the slough between Merced River and San Joaquin River. This station records the flow which at high stages in the Merced River by-passes the Hills Ferry Road Bridge and reaches the San Joaquin River at Mile 122.2 at a point below the Newman gaging station. Period of record 1941 to date. Records for 1953 computed by the U. S. Geological Survey.

U. S. Geological Survey, City of San Francisco, Modesto Irrigation District, and Turlock Irrigation District cooperative station located 0.5 mile downstream from Don Pedro Dam and 3.5 miles upstream from La Grange Dam. Drainage area is 1540 square miles. Period of record 1915 to date. (Prior records available at a site 3.5 miles downstream.) Records for 1953 computed by U. S. Geological Survey.

U. S. Geological Survey and Division of Water Resources cooperative station located three miles southwest of Three Rivers post office. Kaweah River is a tributary of the Tulare Lake area. Period of record 1936 to date. Prior records available at a site two miles upstream. Records for 1953 were computed by the U. S. Geological Survey.

Division of Water Resources and U. S. Bureau of Reclamation cooperative station until September 30, 1953. Subsequent to that date, a U. S. Geological Survey and Division of Water Resources Station located one mile above the head of Porter Slough and 2.2 miles downstream from the junction of South Fork. Period of record 1944 to date. Records for 1953 computed by Division of Water Resources to September 30 and by U. S. Geological Survey for balance of year.
* Estimated mean for period.

Division of Water Resources and U. S. Bureau of Reclamation cooperative station located 1200 feet downstream from the Corcoran-Angiola Highway bridge, 39.2 miles downstream from the junction of South Fork. This station measures inflow to Tulare Lake area and at times the flows are a combination of direct Tule River water, Kaweah River water via Elk Bayou (see Table 157), and Kings River water via Homeland Canal, and waste water from Tulare Irrigation District. Period of record 1942 to date. Records for 1953 computed by Division of Water Resources.

Station is maintained and operated by Tulare Lake Basin Water Storage District. Station is located approximately six miles southwest of Corcoran on the south end of El Rico Bridge. Records are available at this and other sites from 1937 to date.
(a) U. S. Geological Survey datum.
(b) Sump pumped by June 24, 1953.

(a) Additional acre feet diverted: January 2113, February 2089, November 2224 and December 2820.
(b) A portion of this acreage received an undetermined amount of controlled drainage water.
(c) Formerly listed as A. Marty and F. Inderkum.
(d) Miles 8.25R and 8.3R furnished an undetermined amount of water to 40 acres served by 7.7R.
(e) Combined acreage for Miles 8.25R and 8.3R.
(f) Formerly listed as Blauth Estate.
(g) Formerly listed as Henry Amen.
(h) Additional acre feet diverted: November 1.
(i) Additional acre feet diverted: December 5.
(j) Formerly listed as Conaway Ranch.
(k) Additional acre feet diverted: November 626 and December 5241.
(m) This acreage also received an undetermined amount of water from Willow Slough. Includes 925 acres of rice outside of Conaway Ranch and 900 acres reused for duck club lands.
(n) Formerly listed as a 3" unit.
(p) Additional acre feet diverted: February 28, November 17, and December 10.
(q) Of this acreage, 122 were double cropped.
(r) All acreage was double cropped.

✱ Mile 19.6L, Cross Canal. Distance from Sacramento River and bank are shown in ().

(a) Installed prior to 1953, not previously listed.

(b) Mile 16.0L furnished an undetermined amount of water to 497 acres of rice served by Mile 19.6L (2.0S).

(c) This acreage also received an undetermined amount of controlled drain water.

(d) Additional acre feet diverted: February 24.

(e) New installation in 1953.

(f) Formerly listed as a 24" unit.

(g) Combined acreage of Miles (3.3N) and (3.35N).

(h) Formerly listed as West Coast Life Insurance Company.

(i) Includes 638 acre feet furnished to 650 acres of rice served by Mile 6.3L Knights Landing Ridge Cut.

(j) Formerly listed as Mile 28.9L.

(k) All diversion for stock water.

(m) Includes an undetermined amount of water furnished to 70 acres of rice served by Mile 0.82L, Knights Landing Ridge Cut.

(a) Includes 15,486 acre feet delivered to River Farms Company.
(b) Includes acreage as follows: Reclamation District #108 - rice 5560 and general 174, River Farms Company - rice 2323 and general 264.
(c) Additional acre feet diverted: November 5.
(d) Mile 46.45L furnished an undetermined amount of water to 320 acres of rice served by Mile 44.2L.
(e) New installation in 1953.
(f) Includes an undetermined amount of water spilled into a lake.
(g) Includes acreage as follows: Reclamation District #108 - rice 215 and general 190, River Farms Company - rice 447 and general 337.
(h) Additional acre feet diverted: November 120.
(i) Includes 395 acres of River Farms Land.
(j) Additional acre-feet diverted: November 60 and December 62.
(k) Of this acreage 100 were reused for duck club.
(m) This acreage also received an undetermined amount of well water.
(n) Includes 250 acres of Sutter Basin Corporation lands.
(p) Additional acre feet diverted: November 1.
(q) Additional acre feet diverted: November 50 and December 57. Includes an undetermined amount of water returned to river by spill.
(r) Includes 30 acres of abandoned rice planted to milo.
(s) Formerly listed as Jake Locovitch Estate.
(t) Combined acreage for Mile 63.2R and plant on the Back Borrow Pit at Mile 19.9L. This acreage also received 11197 acre feet of water by controlled drainage.

(a) Additional acre feet diverted: November 1417.
(b) The 8" unit was installed in 1953.
(c) Reactivated in 1953. This unit is a Reclamation District #70 drain pump which can divert river water.
(d) The 2-16" units replaced an 18" unit formerly listed at this location.
(e) Includes an undetermined amount of water returned to river by spill.
(f) Does not include 200 additional acres which received an undetermined amount of water from R. D. #108, wells and controlled drainage of this acreage.
(g) Includes 37 acres of Rohleter lands.
(h) The 16" unit replaced 1-6" and 1-24" units formerly listed at this location.
(i) Includes 120 acres of Steidlmayer lands.
(j) Includes 20 acres of George Kauffman lands.
(k) Mile 76.15L furnished an undetermined amount of water to 91 acres served by Mile 76.1L.
(m) Additional acre feet diverted: November 7.
(n) Mile 78.75R furnished an undetermined amount of water to land served by Mile 78.8R.
(p) Includes acreage on following lands: 29 Goodnow and Thomas, 19 Rockholt, 29 Lemos and 29 Staas.
(q) Formerly listed as Mayfair Packing Company.
(r) Includes 62 acres of S. Burtis lands.
(s) An additional 288 acres of rice, and 1117 acres of general crops were irrigated by controlled drainage.
(t) Formerly listed as Roger C. Wilbur.

(a) Includes 60 acres of F. T. Reische lands.
(b) Combined acreage for Miles 83.3L and 83.5L.
(c) Formerly listed as Butte Creek Farms.
(d) This unit replaced an 8" unit formerly listed at this location.
(e) Formerly listed as Olive Percy Davis, et al.
(f) New installation 1953.
(g) Formerly listed as Jacobson and O'Rourke.
(h) Acre feet partially estimated.
(i) Formerly listed as J. Azevedo.
(j) Formerly listed as Mayfair Packing Company.
(k) Formerly listed at Mile 89.25L.
(m) Additional acre feet diverted: November 405.
(n) Mile 89.26L furnished an undetermined amount of water to acreage served by Mile 89.25L.
(p) Combined acreage for Mile 89.25L and plant on Butte Creek at Mile 4.3R.
(q) Additional acre feet diverted: December 13.
(r) Plant was moved to this location from 93.4L.
(s) Includes 10 acres of Halsey lands and 25 acres of Mayfair lands.
(t) Additional acre feet diverted: November 23.
(u) This unit was installed in 1953.
(v) This acreage also received approximately 425 acre feet of water from controlled drainage.

* This is a common point of diversion for Glenn-Colusa, Compton-Delevan and Maxwell Irrigation Districts.

(a) Additional acre-feet diverted: November 69.

(b) Formerly listed as Howard Leach.

(c) Combined acreage for Miles 112.4R, 123.9R and plant on Colusa Trough at Mile 17.2L.

(d) Additional acre-feet diverted: December 2651. Includes 3008 acre-feet furnished to 375 acres of rice of Glenn-Colusa Irrigation, Mile 154.8R.

(e) Combined acreage of this plant and plants on Colusa Trough opposite Miles 20.5R (2.4W), 24.2R (1.5W), 25.8L (2.5W), 27.2R (2.6W) and at Mile 27.2R (0.1). Includes 614 acres of rice and 100 acres of general crops that received 5312 acre-feet of water from Glenn-Colusa Irrigation District, Mile 154.8R.

(f) Additional acre-feet diverted: February 43, November 30.

(g) Plant moved to this location from Mile 125.6R.

(h) Additional acre-feet diverted: November 14.

(i) Additional acre-feet diverted: November 37, December 37.

(j) This acreage also received an undetermined amount of water from Butte Creek.

(k) Additional acre-feet diverted: January 40, February 1.

(m) Of this acreage 25 was irrigated by controlled drainage water.

(n) Combined acreage for Miles 149.7L and 150.0L.

(p) Additional acre-feet diverted: November 8 and December 40.

(q) Additional acre-feet diverted: November 1.

(r) An undetermined amount of water was exchanged between Mile 154.75R and Glenn-Colusa Irrigation District, Mile 154.8R.

(s) Additional acre-feet diverted: November 13989 and by gravity from Stony Creek: March 15470, April 21260, May 20740, June 4350, July 502, August 831, September 774, October 945, and November 203. Includes 5312 acre-feet served to 614 acres of rice and 100 acres of general crops of Provident Irrigation District, Mile 124.2R and 735 acre-feet served to 147 acres of general crops for Princeton-Codora-Glenn Irrigation District, Mile 112.4R.

(t) Includes 375 acres of rice that received 3008 acre-feet from the plant at Mile 124.2R. Includes the following acreage and water served outside the district: 2415 acres of rice received 19322 acre-feet and 159 acres of duck club received 300 acre-feet. A portion of this acreage also received 1754 acre-feet from the plant on Back Borrow Pit at Mile 29.8R (1.4).

(a) This unit replaced a 2½" unit formerly listed at this location.
(b) Additional acre feet diverted: November 1.
(c) Additional acre feet diverted: February 1 and November 1.
(d) Additional acre feet diverted: November 5.
(e) This acreage also received an undetermined amount of water from wells and the Corning Sewage Disposal plant.
(f) Additional acre feet diverted: December 2.
(g) New installation in 1953.
(h) Combined acreage for Miles 168.9R and 169.1R.
(i) This acreage also received an undetermined amount of water from Mill Creek Irrigation District.
(j) This is a portable unit which is also used at Mile 175.5R. However the diversion and acreage listed are totals and are not segregated for the two locations.
(k) Formerly listed as Mile 180.0R.
(m) This acreage also received an undetermined amount of water from Antelope Creek.
(n) Additional acre feet diverted: November 20.
(p) Formerly listed as Dave Singletary.
(q) Installed in 1950. Not previously listed.
(r) Additional acre feet diverted: November 2.
(s) Combined acreage for Miles 207.3L and 207.5L.

* Main Drain of Reclamation District 2047.
** Mileage along Colusa Trough above Colusa-Williams Highway.
(a) Additional acre-feet diverted: November 54.
(b) This acreage also received an undetermined amount of water from controlled drainage.
(c) This acreage was reused for duck ponds.
(d) One 16" unit was installed prior to 1953. Not previously listed.
(e) Additional acre-feet diverted: November 17.
(f) One 16" unit was installed in 1953.
(g) Additional acre-feet diverted: December 15.
(h) Of this acreage 20 were reused for duck ponds and 300 also received an undetermined amount of water from controlled drainage.
(i) Includes an undetermined amount of water returned to Colusa Trough by spill.
(j) Includes 30 acres on Watt Brothers lands.
(k) New installation in 1953.
(m) Includes 30 acres of rice on Coffman and Camel lands.
(n) Of this acreage 200 received an undetermined amount of well water.
(p) Formerly listed as Compton Water District.
(q) Additional acre-feet diverted: November 50 and December 110.
(r) All duck club lands.
(s) Additional acre-feet diverted: November 28.
(t) Of this acreage 17 were reused for duck ponds.
(u) One 16" unit was a temporary installation during 1953.
(v) See Sacramento River Mile 103.7R.
(w) Additional acre-feet diverted: December 130. Includes an undetermined amount of water furnished to 1500 acres rice and 840 acres general in Maxwell Irrigation District in April.
(x) Additional acre-feet diverted: November 103 and December 170.
(y) This unit replaced a 10" unit formerly listed at this location.
(z) Additional acre-feet diverted: November 86 and December 37.
(aa) Additional acre-feet diverted: November 21 and December 50.
(ab) Of this figure 15 were reused by duck clubs.
(ac) See Sacramento River Mile 112.4R.
(ad) Additional acre-feet diverted: November 29 and December 37.
(ae) Of this acreage 20 were duck ponds.
(af) See Sacramento River Mile 124.2R.
(ag) The 8" unit was installed in 1953.
(ah) Additional acre-feet diverted: November 198. Includes the following acre-feet diversions for duck ponds: September 198 and October 614.
(ai) The 12" unit was installed in 1953.
(aj) Formerly listed as J. Azevedo.
(ak) Additional acre-feet diverted: January 11, February 17, November 19, and December 10.
(am) Additional acre-feet diverted: January 480 and February 948.

* Back Borrow Pit of Reclamation Districts 108 and 787 carries return water from Colusa Basin for discharge to Sacramento River at Mile 34.15R or partial diversion via Knights Landing Ridge Cut.

** Mileage along Borrow Pit from Knights Landing Outfall Gates above junction with Sacramento River.

(a) This acreage also received an undetermined amount of well water.

(b) Includes the following acreages: 75 Ray Houx, 125 William Crawford and 80 William Walker Estate.

(c) Includes an undetermined amount of water returned to Borrow Pit by spill. Additional acre-feet diverted: December 103.

(d) Of this acreage 50 were reused for duck club.

(e) A 14" unit was removed in 1953.

(f) Includes an undetermined amount of water returned to Borrow Pit by spill.

(g) Mile 15.5R furnished an undetermined amount of water to lands served by Mile 15.75R.

(h) Miles 15.75R and 18.5R (0.8) furnished an undetermined amount of water to lands served by Mile 18.1R.

(i) Additional acre-feet diverted: December 240.

(j) See Sacramento River Mile 63.2R.

(k) Additional acre-feet diverted: December 124.

(m) This unit replaced a 12" unit formerly listed at this location.

(n) Includes 20 acres of L. Arcand lands.

(p) The 14" unit was installed in 1953.

(q) Additional acre-feet diverted: November 183.

(r) Includes 75 acres of Spicer lands.

(s) One 16" unit was installed in 1953.

(t) Additional acre-feet diverted: February 98.

(u) Includes 254 acres of L. Traynham lands.

(v) Additional acre-feet diverted: November 62 and December 137.

(w) Includes following acreages: 347 F. Grevie and 193 A. Christian. Of this acreage 5 were reused for duck club.

(x) Formerly listed as Roy E. Kittz.

(y) Of this acreage 150 also received an undetermined amount of well water. Includes 200 acres of C. W. and M. E. Struckmeyer lands.

* Mileage on Butte Creek is approximate mileage from junction with Butte Slough at Mile 0.6E.

* Mileage on Butte Slough is from its junction with Sacramento River at Mile 84.0L

(a) Additional acre-feet diverted: November 410 and December 418.
(b) See Sacramento River Mile 89.25L.
(c) Additional acre-feet diverted: November 3000 and December 3000.
(d) See Sacramento River Mile 112.1L.
(e) Additional acre-feet diverted: December 180.
(f) Additional acre-feet diverted: November 100.
(g) Estimated acre-feet diverted: November 3000 and December 3000.
(h) All gun club lands. Acreage is partially estimated.
(i) Additional acre-feet diverted: November 19.
(j) Additional acre-feet diverted: November 101 and December 19.
(k) All duck club.
(m) The 20" unit replaced an 18" unit formerly listed at this location.
(n) This acreage also received an undetermined amount of water from the 14" portable unit. See note (q).
(p) New installation in 1953.
(q) This is a portable unit which pumped at Mile 21.0R and Opposite Mile 20.9R (0.5W).
(r) Flow in Butte Slough, derived from Butte Creek, is controlled by Outfall Gates at junction with Sacramento River and is thereby retained in Butte Slough to discharge into East and West Borrow Pits of Sutter By-Pass near "Long Bridge". The Outfall Gates are maintained by the Division of Water Resources and are operated cooperatively with the Butte Slough Irrigation Company. See Sutter By-Pass Diversions.
(s) See acreages under rediversion - West Borrow Pit Sutter By-Pass.
(t) Formerly listed as a 12" unit.
(u) Combined acreage for Miles 0.9E and 1.4E. Includes 8 acres of Browning Estate lands.
(v) Formerly listed as a 7" unit.
(w) Additional acre-feet diverted for duck club: November 5.
(x) Additional acre-feet diverted: February 1.
(y) This unit replaced a 10" unit formerly listed at this location.
(z) Mile 5.1W furnished an undetermined amount of water to land served by Mile 4.8W.

--RECLAMATION BOARD DRAINAGE PLANT #2--	10.0N												

* Mileages on West Borrow Pit are given northerly from drainage plant of Reclamation District 1500. Mile 9.15 on West Borrow Pit is opposite Chandler.
§ Area irrigated is within By-Pass.
‡ Water used for irrigation in Sutter By-Pass is mainly Feather River return water which enters East and West Borrow Pits via Butte Creek, Butte Slough and Wadsworth Canal.
† Mileages on East Borrow Pit are given northerly or southerly from Chandler.
‡ Plant is on the main drain canal for drainage plant #1 that joins East Borrow Pit Sutter By-Pass at Mile 1.4N. Figure in () indicates distance along drain from East Borrow Pit.

(a) The 16" unit was installed in 1953.
(b) Combined acreage for Miles 25.0R and 28.4R.
(c) Additional acre-feet diverted: November 13.
(d) Of this acreage 5 were reused for duck club.
(e) This unit replaced a 16" unit formerly located at this location.
(f) Additional acre-feet diverted: December 10.
(g) The 12" plant at Mile 1.4N (3.3) furnished 1313 acre-feet, and the 16" plant at Mile 1.4N (3.3) furnished an undetermined amount of water to 600 acres of rice served by Mile 1.4N (1.3).
(h) The 16" plant at Mile 1.4N (3.3) furnished an undetermined amount of water to acreage under plant at Mile 1.4N (4.0).
(i) Combined acreage for Miles 2.9N and 4.0N.
(j) One 14" unit was installed in 1953.
(k) Formerly listed as R. E. Hughes #3.
(m) Combined acreage for Miles 5.7N and 7.1N.
(n) This acreage was originally planted to rice which was flooded out in May.
(p) New installation in 1953.
(q) One 16" unit was removed in 1953.
(r) Combined acreage for Miles 9.99N and 10.0N. General acreage is all duck club.
(s) Additional acre-feet diverted: November 34 and December 100.

* Mileages of East Borrow Pit are given northerly or southerly from Chandler.

* Water used for irrigation in Sutter By-Pass is mainly Feather River return water which enters East and West Borrow Pits via Butte Creek, Butte Slough and Wadsworth Canal.

ß Area irrigated is within By-Pass.

¥ Plant is on drain canal for Drainage Plant #2 that joins East Borrow Pit of Sutter By-Pass at Mile 10.0N. Figure in () indicates distance along drain from East Borrow Pit.

¥ Plant is on Wadsworth Canal which joins East Borrow Pit Sutter By-Pass at Mile 16.5N. Figure in () indicates distance along Canal from East Borrow Pit.

ð Plant is on Poodle Creek which joins East Borrow Pit - Sutter By-Pass at Mile 16.7N. Figure in () indicates distance along Creek from East Borrow Pit.

* Mileages on Sacramento Slough are given easterly from head of Slough at drainage plant of Reclamation District 1500.

(a) Reinstallation in 1953 of a plant previously removed.

(b) The 20" unit was formerly listed as a 16" unit and the 30" unit replaced a 16" unit formerly listed at this location.

(c) See Feather River Mile 38.1R.

(d) New installation in 1953.

(e) Includes an undetermined amount of water returned to drain by spill.

(f) Additional acre-feet diverted: February 224.

(g) A 20" unit was removed in 1953.

(h) Additional acre-feet diverted: November 750 and December 800.

(i) Additional acre-feet diverted: November 21 and December 39.

(j) All duck refuge.

(k) This acreage was reused for duck club.

(m) The 10" unit was installed in 1953.

(n) Combined acreage for Miles 1.35R and 1.36R.

(p) Formerly listed as a 12" unit.

(q) Includes 34 acres of Joaquin lands.

(r) Combined acreage for Miles 16.7N (1.49) and 19.1N.

(s) Additional acre-feet diverted: December 47.

* Honcut Slough Plants divert Feather River water backed into Slough. Mouth of Slough at Mile 43.7L. Distance from Feather River and bank is shown in ().

(a) Installed in 1953 at old point of diversion.
(b) All Spangler Brothers lands.
(c) This acreage also received an undetermined amount of well water.
(d) Additional acre-feet diverted: November 1.
(e) One 24" unit was removed in 1953.
(f) Additional acre-feet diverted: February 49.
(g) Also received an undetermined amount of controlled drainage water.
(h) Formerly listed as Farm Lands Company.
(i) One 20" unit replaced a 15" unit formerly listed at this location.
(j) Additional acre-feet diverted: November 32.
(k) This acreage also received an undetermined amount of well and controlled drainage water.
(m) Includes 20 acres outside district. Of this acreage, 115 also received an undetermined amount of well water.
(n) Formerly listed as Alfred Montna.
(p) This is the combined acreage for Mile 38.1R, the Sutter Extension Water District diversion at Mile 58.1R, and Miles 10.0N (2.0) and (6.7) on East Borrow Pit of Sutter By-Pass. This acreage also received an undetermined amount of controlled drainage water.
(q) Of this acreage 75 also received an undetermined amount of well water.
(r) Mile 48.3L furnished an undetermined amount of water to 170 acres served by Mile 48.0L.
(s) Includes 7 acres of M. A. Pedroza and Sons land.

* This is a common point of diversion for Sutter Butte Canal Company, Biggs-West Gridley Water District, Richvale Irrigation District and Sutter Extension Water District.
(a) Includes an undetermined amount of water returned to river by spill.
(b) Additional acre-feet diverted: November 2380.
(c) Additional acre-feet diverted: November 2529.
(d) Additional acre-feet diverted: November 2408.
(e) Additional acre-feet diverted: November 1716.
(f) See Mile 38.1R.
(g) Includes 7202 acre-feet of duck water in October. Additional acre-feet diverted (duck water): November 4383.

* Mileage listed is approximate mileage above New Hope Bridge.
(a) New installation in 1953.
(b) Formerly listed as T. C. Green.
(c) Formerly listed as A. E. Jones.
(d) Additional acre-feet diverted: February 96.
(e) Installed prior to 1953. Not previously listed.
(f) A 3" unit formerly listed at this location was removed.
(g) Formerly listed as W. E. Mehlhoff.
(h) Additional acre-feet diverted: February 2.
(i) Formerly listed as V. and E. Hoffman.
(j) This 6" unit was installed in 1953.
(k) Formerly listed as a 7" unit.
(m) Formerly listed as an 8" unit.
(n) Formerly listed as L. Schenmann.
(p) This unit replaced a 12" unit formerly listed at this location.
(q) Additional acre-feet diverted: November 1.
(r) The 7" unit was a temporary installation during 1953.
(s) Formerly listed as Schuman Company.
(t) Formerly listed as a 6" unit.
(u) This acreage also received an undetermined amount of well water.
(v) Formerly listed as Campo Vineyards.
(w) Additional acre-feet diverted: February 9.
(x) Formerly listed as Neil C. Locke.
(y) Mile 34.55L furnished an undetermined amount of water to Mile 33.75L.
(z) Additional acre-feet diverted: February 1.
(aa) Includes 3 acres of Leonard Mettler lands.
(ab) Additional acre-feet diverted: February 2 and November 2.
(ac) This unit replaced an 8" unit formerly listed at this location.
(ad) Additional acre-feet diverted: November 5.
(ae) Of this acreage 136 also received an undetermined amount of well water.
(af) Additional acre-feet diverted: November 1 and December 1.
(ag) Formerly listed as a 10" unit.
(ah) Additional acre-feet diverted: November 7.
(ai) Of this acreage 25 also received an undetermined amount of well water.
(aj) This unit replaced a 10" unit formerly listed at this location.

* North Slough - North Slough diverts from Calaveras River at Mile 21.6R. Distance from Calaveras River and bank is shown in ().

* Mormon Slough - Mormon Slough diverts from Calaveras River at Mile 25.3L, and rejoins river through Stockton Diverting Canal. Distance from Calaveras River and bank is shown in ().

(a) Formerly listed as Mile 21.6R (5.9R).
(b) Formerly listed as a 12" unit.
(c) Combined acreage of Miles 15.4R and 21.6R (6.1L).
(d) New installation in 1953.
(e) This acreage also received an undetermined amount of well water.
(f) Formerly listed as J. W. Hannah.
(g) Formerly listed as an 8" unit.
(h) Of this acreage 64 also received an undetermined amount of well water.
(i) Formerly listed as Mile 21.9L.
(j) This unit replaced a 5" unit formerly listed at this location.
(k) Formerly listed as Mile 23.8L.
(m) Formerly listed as a 10" unit.
(n) Formerly listed as a 14" unit.
(p) This acreage also received an undetermined amount of well water and controlled drainage water.
(q) Formerly listed as Armaninio Brothers.
(r) Formerly listed as Sadaki Higashi.
(s) Formerly listed as Mile 1.8R.
(t) Formerly listed as V. Lagorio.
(u) Installed prior to 1953. Not previously listed.
(v) Formerly listed as Mile 7.1L.

* Mileage along Old San Joaquin River from mouth of San Joaquin River 4½ miles below Antioch.
‡ Indian Slough joins the Old San Joaquin River at Mile 36.5L. Pumping plant is located on intake canal which joins Indian Slough.
¥ Italian Slough joins the Old San Joaquin River at Mile 40.9L. Pumping plant is located on intake canal which joins Italian Slough.
Pumping plant is located on intake canal which joins Old San Joaquin River at Mile 47.65L.
(a) Point of diversion is at head of Rock Slough.
(b) Additional acre-feet diverted: January 1951, February 1732, November 2463 and December 2414.
(c) In addition to this acreage, water was also served for industrial and municipal uses.
(d) Additional acre-feet diverted: February 50 and November 12.
(e) This acreage also received 3898 acre-feet of well water.
(f) Additional acre-feet diverted: February 236 and November 91.
(g) Additional acre-feet diverted: November 1.
(h) Additional acre-feet diverted: February 30 and November 161.
(i) This acreage also received an undetermined amount of water from Mountain House Creek.
(j) Additional acre-feet diverted: February 354, November 301 and December 81.
(k) Of this acreage, 764 were double cropped. General acreage reported as 10094 acres in 1952 report, should have been 10686 acres.
(m) Additional acre-feet diverted: February 7.
(n) Additional acre-feet diverted: February 41 and November 2.
(p) Formerly listed as Salles Brothers.
(q) Additional acre-feet diverted: February 2.
(r) Additional acre-feet diverted: February 4 and November 1.
(s) Additional acre-feet diverted: February 9136, November 1418 and December 875.

* Mileage along San Joaquin River from its mouth 4½ miles below Antioch.
(a) Additional acre-feet diverted: February 8 and November 9.
(b) Includes an undetermined amount of water returned to river by spill.
(c) Additional acre-feet diverted: November 3 and December 2.
(d) Additional acre-feet diverted: February 1.
(e) Additional acre-feet diverted: February 1, November 2 and December 2.
(f) This acreage was double cropped.
(g) A 12" unit was removed in 1953.
(h) Additional acre-feet diverted: November 16.
(i) Mile 53.7R furnished an undetermined amount of water to acreage served by Mile 53.8R.
(j) Additional acre-feet diverted: February 33 and November 15.
(k) Additional acre-feet diverted: November 4.
(m) Additional acre-feet diverted: November 28.
(n) Of this acreage 10 were double cropped.
(p) New installation in 1953.
(q) Additional acre-feet diverted: December 1.
(r) Additional acre-feet diverted: February 4 and November 3.
(s) Additional acre-feet diverted: November 1.
(t) Of this acreage 35 were double cropped.
(u) Plant is located on south side of Paradise Cut 0.9 miles from junction with San Joaquin River.
(v) Additional acre-feet diverted: November 16 and December 80.
(w) Includes 300 acres of State of California lands.
(x) Additional acre-feet diverted: February 1576 and November 146.
(y) Acreage includes the following outside the district: Banta Farms 811, Kasson District 599 and outside contracts 1168. Acreage includes 606 acres double cropped in the district. This acreage also received an undetermined amount of controlled drainage water.

* Mileage along San Joaquin River from its mouth 4½ miles below Antioch.
* West Stanislaus Irrigation District Intake Canal - The Intake Canal joins the San Joaquin River at Mile 91.8L. Distance from the San Joaquin River and the bank is shown in ().
(a) Includes 60 acres of Chisholm lands.
(b) Additional acre-feet diverted: February 124.
(c) The 10" unit was a temporary installation for 1953.
(d) Additional acre-feet diverted: February 98, November 72, and December 71.
(e) This acreage also received an undetermined amount of controlled drainage water and an undetermined amount of water from Mile 81.95L.
(f) Includes an undetermined amount of water furnished to Mile 81.8L.
(g) Includes an undetermined amount of water returned to river by spill. Additional acre-feet diverted: February 188 and November 172.
(h) Of this acreage 257 were double cropped and 268 acres also received an undetermined amount of well water. This acreage also received an undetermined amount of controlled drainage water.
(i) Additional acre-feet diverted: February 1979, November 184, and December 179.
(j) This acreage also received 7009 acre-feet of Delta Mendota Canal water as follows: April 1538, June 249, July 2531, and August 2691. Of this acreage 1583 were double cropped. Includes 1785 acres irrigated outside of district.
(k) Additional acre-feet diverted: February 9.
(m) Additional acre-feet diverted: November 9.
(n) Additional acre-feet diverted: February 61 and November 8.
(p) Of this acreage 85 were double cropped.
(q) Additional acre-feet diverted: November 2.
(r) Plant installed prior to 1953. Not previously listed.
(s) Pumping plant is located on old channel which joins the river at Mile 94.1L.
(t) Additional acre-feet diverted: November 13.
(u) Of this acreage 15 were double cropped.

* Mileage along San Joaquin River from its mouth 4½ miles below Antioch. (Mileage as established by War Department Survey 1913-15).
(a) This acreage also received an undetermined amount of well water.
(b) This is a portable unit which diverts water at Mile 163.2R and the East Side Canal.
(c) Plant is located on East Side Canal which diverts from San Joaquin River at this mile.
(d) Point of diversion is at head of Temple Slough.
(e) Point of diversion is considered to be Mendota Pool.
(f) Includes Main and Outside Canals and Helm Ditch.
(g) Includes some double cropping and interplanting.
(h) Data furnished by U. S. Bureau of Reclamation.
(j) Scattered flooding of an estimated acreage of grazing land and duck ponds.
(k) This acreage also received 37815 acre-feet of water from Delta-Mendota Canal.
(m) This acreage also received 1975 acre-feet of water from Delta-Mendota Canal.
(n) Acreage not available.
(p) Supplemental water for district acreage of 16207 acres.
(q) Includes gravity diversion in Lone Willow Slough, Mowry Canal and Mendota Pool pumps.

* Distance along San Joaquin River from its mouth 4½ miles below Antioch.
* Point of diversion and place of use is on island in midstream.
(a) Combined acreage for plants at Miles 257.1L and 257.7L.
(b) Combined acreage for plants at Miles 258.80L and 258.90L.
(c) New installation in 1953.
(d) Combined acreage for plants at Miles 261.90 and 262.07.
(e) Of this figure 26 acres received an undetermined amount of well water.
(f) Combined acreage for plants at Miles 262.43L and 262.48L.
(g) Plant at Mile 263.40R furnished an undetermined amount of water to acreage under plant at Mile 262.60R.
(h) Pump is located on pond whose major source of supply is from the Pacific Coast Aggregate Company plant located at this mile.
(i) Combined acreage for plants at Miles 264.00L (#3), 264.00L (#2), and 264.08 (#4).
(j) Pertinent data furnished by U.S. Bureau of Reclamation.

TABLE 187

DIVERSIONS AND ACREAGES IRRIGATED - FRESNO SLOUGH AND JAMES BY-PASS (a) - 1953
(The following table arranged from data furnished by U.S. Bureau of Reclamation)

Water User	Miles*		Monthly Diversions in Acre-Feet											Total Diversion	Acreage Irrigated

Monthly use in per cent of seasonal			0	3.6	6.4	6.2	15.5	17.2	21.2	22.6	7.3	0	0	0			

* Mileage along Fresno Slough from its Mouth.
* Plant is located on James By-Pass. Mileage above Confluence of James By-Pass with Fresno Slough is indicated in ().
(a) The water in Fresno Slough and James By-Pass is mainly derived from the San Joaquin River (Mendota Pool backwater created by Mendota Dam) and is occasionally augmented by flows from the Kings River via James By-Pass.
(b) Includes water pumped from Slough Channel.
(c) Acreage not available.

(a) Additional acre-feet diverted: February 2.
(b) Additional acre-feet diverted: November 12.
(c) Formerly listed as A. Bianchi.
(d) Additional acre-feet diverted: February 43.
(e) New installation in 1953.
(f) Includes an undetermined amount of water returned to river by spill.
(g) Includes 160 acres of Henry Pelucca lands. Of this acreage 160 received an undetermined amount of well water.
(h) Additional acre-feet diverted: February 230 and November 146.
(i) Additional acre-feet diverted: February 536 and November 109.
(j) Additional acre-feet diverted: February 33.
(k) Additional acre-feet diverted: February 68 and November 2.
(m) Additional acre-feet diverted: February 49 and November 29.
(n) Of this acreage 20 were double cropped.
(p) Additional acre-feet diverted: February 8.
(q) This acreage was double cropped.
(r) This acreage also received an undetermined amount of Modesto Irrigation water.
(s) Formerly listed as Edward B. Regan.
(t) Additional acre-feet diverted: November 25.
(u) Additional acre-feet diverted: February 4.
(v) Additional acre-feet diverted: February 14.
(w) Oakdale Irrigation District for season of 1953 maintained plants at Miles 35.9L and 37.0L to supplement District gravity supply.
(x) Additional acre-feet diverted: February 7.
(y) Of this acreage 277 were double cropped.
(z) Of this acreage 80 were double cropped. This acreage also received an undetermined amount of well water.

* Mileage downstream from junction with South Fork Tule River.
(a) This acreage is partially estimated.
(b) This acreage also received an undetermined amount of well water.
(c) Includes an undetermined amount of water served to the Vandalia Irrigation District.
(d) This figure is the measured flow at the head of Porter Slough minus the diversion of Porter Slough Ditch.
(e) Use other than replenishing ground water is negligible.
(f) Point of diversion is on Porter Slough, 4.5 miles below head.
(g) Figures from January through July furnished by Vandalia Irrigation District.
(h) This acreage also received an undetermined amount of water from the Campbell-Moreland Ditch. This acreage is pasture land and is used as a well field by Vandalia Irrigation District.
(i) This figure is measured diversion at head minus measured spill to river at Mile 12.9R. Hubbs-Miner Ditch Company receives approximately 71.4 per cent of measured diversion at head while Gilliam-McGee Ditch Company received approximately 28.6 per cent.
(j) Includes 1777 acres in the Hubbs-Miner Ditch Company and 323 acres in the Gilliam-McGee Ditch Company.
(k) The source of the water diverted by Little Pioneer Ditch may be from the Tule River or the Friant-Kern Canal. No segregation was made in 1953.

1929	95000	74000	78	1939	120000	104000	87	1949	298000	236000	79
1930	110000	88000	80	1940	118000	94000	80	1950	240000	187000	78
1931	125000	126000	100	1941	153000	120000	78	1951	319000	240000	75
1932	110000	91000	83	1942	212000	159000	75	1952	335000	245000	73
1933	108000	87000	81	1943	237000	186000	78	1953	425000	297000	70

(a) As reported by Federal-State Crop Reporting Service.
(b) Does not include the rice acreage of Merced, Turlock, Modesto, Waterford, Oakdale and South San Joaquin Irrigation Districts, and Friant-Kern and Madera Canals. Prior to 1947, the rice acreage in the reach from Fremont Ford to Friant Dam of the San Joaquin River was not included.
(c) Ratio of rice acreage in Sacramento and San Joaquin River Systems to total rice acreage in State.

* Estimated.
(a) For maximum salinities recorded and not shown in this table, see previous reports.
(b) Normal taken as 60-year (1889-1949) mean annual unimpaired flow (Oct.-Sept., Incl.) at foothill stations of major tributaries.
(c) For location and description see Table 210.
(d) Record incomplete.
(e) Station established during 1952.

(a) Normal = 60-year (1889-1949) mean annual unimpaired flow (October - September, incl.).
(b) Does not include inflows from Mokelumne and Calaveras Rivers, Yolo By-Pass and other minor tributaries.
(c) Delta area taken at 435,000 acres which includes all lands, levees, water surfaces, etc., within Delta boundary.
(d) Sacramento and Mokelumne deltas combined as the Sacramento River contributes a large flow to Mokelumne River Delta through Georgiana and Three Mile Sloughs.
(e) No continuous record. Lowest discharge measured.
(f) Figure shown is minimum 10-day flow during summer. Minimum 10-day flow for year occurred March 8 with average flow of 357 cfs.
(g) Figure shown is minimum 10-day flow during summer. Minimum 10-day flow for year occurred in November.

TABLE 210

DESCRIPTION OF ACTIVE SALINITY OBSERVATION STATIONS - 1953

(Refer to previous Water Supervision Reports for description of stations which have been discontinued.)

Station	Miles from Golden Gate (a)	Time Interval (b) Hours	Time Interval (b) Mins.	Location
				SAN FRANCISCO, SAN PABLO, AND SUISUN BAYS
Point Orient	12.3	2	20	North end of San Francisco Bay, East Shore, one-half mile south of Point San Pablo Wharf of Standard Oil Company.
Point Pinole	19.0	2	50	South Shore of San Pablo Bay, at Point Pinole on wharf of Atlas Powder Company.
Point Davis	25.2	3	15	East end San Pablo Bay. South Shore, Oleum Wharf of Union Oil Company.
Grand View	25.2	3	15	Northwest Shore of San Pablo Bay at mouth of Petaluma Creek.
Crockett	27.7	3	30	West end of Carquinez Strait, South Shore, 0.2 mile east of Carquinez Bridge on wharf of C. and H. Sugar Refining Corporation.
Benicia	32.5	3	50	East end of Carquinez Strait, North Shore, 1.1 mile west of Southern Pacific Company railroad bridge, at Benicia Arsenal.
Martinez	32.7	3	50	East end of Carquinez Strait, South Shore, 1.0 mile west of Southern Pacific Company railroad bridge, at Municipal Ferry Slip. (Bulls Head Point).
West Suisun	37.0	4	10	West end of Suisun Bay, North Shore, 2.5 miles northeast of Southern Pacific railroad bridge at service pier of U. S. Maritime Commission, Reserve Fleet Mooring area.
Port Chicago	41.0	4	20	South Shore of Suisun Bay at U. S. Naval ammunition loading wharf below Port Chicago.
O & A Ferry	46.5	4	40	Upper end Suisun Bay between Mallard Station and Chipps Island at Sacramento Northern Railroad Ferry Crossing.
Innisfail Ferry	47.3	4	50	Montezuma Slough, about one mile east of junction with Cutoff Slough near North end of Grizzly Island.
Pittsburg	48.0	5	00	East end of Suisun Bay, South Shore. at Pittsburg Yacht Harbor.
				SACRAMENTO RIVER DELTA
Collinsville	50.8	5	25	Sacramento River, north bank at junction with San Joaquin River.
Toland Landing	57.2	5	45	Sacramento River, west bank, 5.3 miles downstream from Rio Vista at Dozier Ranch.
Threemile Slough Bridge	60.0	5	55	At junction of Slough and Sacramento River.
Rio Vista Bridge	63.5	6	05	At Highway Bridge near northerly limits of Rio Vista.
Isleton Bridge	68.7	6	30	Sacramento River, one mile upstream from Isleton.
				SAN JOAQUIN RIVER DELTA
Antioch	54.9	5	55	San Joaquin River, at City Water Works pumping plant.
Millers Harbor	58.2	6	10	South Shore San Joaquin River at Antioch Bridge.
Jersey Island	61.4	6	20	San Joaquin River, left bank, one mile below mouth of False River.
Threemile Slough (S.J.)	64.2	6	30	Threemile Slough, west bank, at junction of Slough with the San Joaquin River.
Oulton Point	67.2	6	40	San Joaquin River, right bank, three miles upstream from junction of Threemile Slough.
San Andreas Landing	70.3	6	55	San Joaquin River. right bank, one mile below the mouth of the Mokelumne River.
Opposite Central Landing	72.0	7	00	Mokelumne River, on Andrus Island directly opposite Central Landing on Bouldin Island.
Dutch Slough	73.0	7	05	At Bethel Island Bridge.
Piper Slough	73.0	7	00	Piper Slough at Delta Fishing Resort on Bethel Island one-half mile north of Sand Mound Slough junction.
Webb Ferry	68.0	6	40	False River at Junction with Fisherman's Cut.
Holland Tract	77.5	7	35	Old River two miles north of Rock Slough junction.
East Contra Costa I.D.	86.7	8	20	Indian Slough, at East Contra Costa Irrigation District Pumping Plant
Clifton Court Ferry	94.2	9	10	Old River just below junction with Grant Line Canal
Mossdale Bridge	108.5	10	50	San Joaquin River at U. S. 50 Highway Crossing about three miles southwest of Lathrop.
Vernalis (Durham Ferry Bridge)	127.0	11	00	San Joaquin River at Durham Ferry Bridge, above tidal influence.

(a) Mileage measured to station along main channel. For stations off the main channel, the mileage shown is the same distance along the main channel to a point whereon the time of the occurrence of the tidal phase is the same as that of the observation station.

(b) Time interval between high tide at Golden Gate and time for taking samples at station.

TABLE 211

SALINITY OBSERVATIONS, SACRAMENTO-SAN JOAQUIN DELTA AND UPPER BAYS

Samples taken by local observers approximately one and one-half hours after high high tide
Salinity expressed in parts of chloride per million parts of water.
