FOREWORD

This report presents hydrologic data for the hydrographic regions of Northern and Central California. These data were collected by the four area branches of the department: Northern, Bay Area, Delta, and San Joaquin Valley. Each branch uses standard hydrographic procedures in the collection of these data.

The department cooperates in the collection of data from a network of approximately 400 stream gaging stations, whose records are published by the U. S. Geological Survey in the annual water supply paper. The data collected by the department and presented in this report augment data from stream gaging stations of other agencies.

The reporting period is the Water Year (October 1 to September 30) for streamflow data, and the Diversion Year (November 1 to October 30) for the diversion data contained herein. Stages are tabulated daily for the period November 1 to June 30.

DEPARTMENT OF WATER RESOURCES

1120 N STREET, SACRAMENTO

May 10, 1963

Honorable Edmund G. Brown, Governor,
and Members of the Legislature of
the State of California

Gentlemen:

I have the honor to transmit herewith Bulletin No. 23-61, "Surface Water Flow for 1961." This report is a continuation of the annual series which commenced in 1924 and contains basic data of water flow, diversions, stream stages, and salinity. Although the majority of the material pertains to the Sacramento and San Joaquin Rivers and their tributaries, the data is presented on a regional basis in accordance with the subdivision of the State into hydro-graphic areas.

The data presented in this report covers another year of substantially below normal runoff. Flow data show many streams dry during the summer months when normally they supply water for irrigation and other uses.

Sincerely yours,

Director

ACKNOWLEDGMENTS

Cooperation and assistance have been received by the department in the collection of these data from various public and private agencies. This department is grateful to those agencies and appreciates this opportunity to acknowledge their help.

The United States Department of the Interior, Geological Survey and Bureau of Reclamation, furnished stream stage and flow data, and data on the reservoirs of the Central Valley Project, respectively. The United States Department of the Army, Corps of Engineers, has made available streamflow data for certain San Joaquin Valley streams.

The Pacific Gas and Electric Company, the Sacramento Municipal Utility District, and the Modesto and Turlock Irrigation Districts have furnished a large number of electric power consumption records for computation of the quantity of water pumped from streams.

The City of San Francisco Public Utilities Commission has assisted in the collection of other hydrologic data presented in this report.

DIVISION OF RESOURCES PLANNING

William L. Berry Division Engineer
Albert J. Dolcini Chief, Planning Management Branch
Arthur L. Winslow, Jr. Associate Engineer, Water Resources

This report was assembled from material supplied
by the four area branches*

Northern Branch

John M. Haley Branch Chief
R. Paul Art Chief, Watermaster and Measurement Unit
Walter D. McIntyre Water Resources Engineering Associate

Delta Branch

Carl A. Werner Branch Chief
Jacob Angel Chief, Hydrology Unit
Joseph L. Clausse Water Resources Engineering Associate

San Joaquin Valley Branch

Carl L. Stetson Branch Chief
Cledith L. Chastain Chief, Hydraulic Unit
Patrick E. Logan Assistant Civil Engineer

Bay Area Branch

Charles A. McCullough Branch Chief
Glenn R. Peterson Chief, Water Supply Unit
John C. Etchells Water Resources Engineering Associate

* On August 4, 1961, the four area branches were organized. Prior to this time, data were collected by the Surface Water Unit of the Division of Resources Planning, Department of Water Resources.

INTRODUCTION

This report presents surface water data for the Water Year 1961 which is from October 1, 1960, to September 30, 1961. The data presented here consists of stream gaging station descriptions, streamflow quantities, stream stage tables, diversion quantities, and salinity observations.

Stream gaging station descriptions presented here show the historic maximum discharge and the maximum discharge for the report year. Written detailed locations of the gaging stations and other important data on the length of record and datum of gage are also presented.

Quantities of daily mean discharge for most stations shown here are computed by an electronic computer which was first used extensively for this purpose in this report. The gage height data are fed into the computer simultaneously with rating data, and daily mean discharges, total monthly acre-feet, and instantaneous maximum and minimum discharges are computed. The gage height data are extracted from the standard recorder chart by a semi-automatic chart reading machine and put into machine language. Those gaging stations presented here which are affected by a backwater condition are not adaptable to computation by machine method, and are computed manually by standard methods.

Daily mean stage tables of regular and tide affected streams are shown here. These daily mean gage heights are computed by the electronic computer, as mentioned above. The gage height data are to the nearest one-hundredth of a foot, and the major crests for the year are shown.

Quantities of water diverted for use are shown as monthly total acre-feet and total acre-feet diverted for a certain reach of stream.

Accretions to Streamflow

There are large quantities of accretions to the flows of the streams and channels in their courses across the valley floors. These accretions are of major importance as available irrigation supplies. They are made up of measured flows from surface drains, from scores of small surface drains, and other flows not susceptible to direct measurement, such as from minor ephemeral streams, from seepage and return of percolated irrigation water, and from escaping underground water normally present as the result of percolated rainfall on the valley floor. The amount of total accretion along any stream reach is the summation of amounts of measured drains plus unmeasured accretions.

Because accretions are not a measured quantity, but rather the result of subtracting measured upstream flow from the flow at a station downstream, they contain all the errors of measured flow involved. For this reason, figures of accretions have not been included in this report.

"Report of Sacramento-San Joaquin Water Supervision" was published annually from 1924 through 1955. Data pertinent to that area is now included as a part of this publication.

Data formerly appearing in "Flood Flows and Stages in Sacramento and Northern San Joaquin Valleys," published from 1913 through 1956, are also included as a part of this bulletin.

The objective of this report is to bring together, in a permanent and usable form, all surface flow data gathered by the Department of Water Resources during the 1961 water year. Other relevant data are added for the convenience of the user.

Definitions of Terms

A list of definitions of terms as used herein follows:

Second-foot or cubic foot per second is the unit rate of discharge of water. It is a cubic foot of water passing a given point in one second.

Acre-foot is the quantity of water required to cover one acre to a depth of one foot. It is equivalent to 43,560 cubic feet or 325,850 gallons.

Drainage area of a stream at a specified location is that area, measured in a horizontal plane, which is enclosed by a drainage divide.

Unimpaired runoff is the flow that would occur naturally at a point in a stream if there were: (1) no upstream controls such as dams and reservoirs; (2) no artificial diversions or accretions; and (3) no changes in ground water storage resulting from development. Unimpaired flow is computed from measured runoff by allowing for man-made changes in natural conditions.

Water Year is the 12-month period from October 1 of any year through September 30 of the subsequent year, and is designated by the calendar year in which it ends.

Consumptive use is the water transpired, evaporated, and used in promoting vegetative growth plus the water evaporated from adjacent soil and water surfaces.

Scope

The work of the Department of Water Resources is concerned with gathering basic data relating to water supply and utilization. In addition to the collection of data on operational water supply, the department is actively engaged in the collection of hydrologic water supply data to augment the base network of the United States Geological Survey. The work consists of field measurements and observations and office computations to determine the daily or monthly quantities of streamflow and diversions. The work also includes maintaining the Delta salinity observation program.

The field activities include the construction and maintenance of streamflow gaging stations, and the measurements of (1) flow in streams and drainage channels, (2) the amounts of water returned to natural channels through drainage plants or gravity drains, and (3) the amounts of water diverted for use by each water user. The field work also includes the recording of the diversions and acreages irrigated by the large eastside irrigation districts (Modesto, Merced, Oakdale, South San Joaquin, and Turlock), and the diversions and deliveries by the canals of the Central Valley Project.

The office work is comprised of the preparation of hydrographic data for computation by machine methods. This work consists of developing a rating curve for each stream flow station from a series of instantaneous discharge measurements, and a related formula of the curve. The formula is written in electronic computer language as rating data for computation as previously mentioned.

The office work also includes the manual computation and compilation of the discharge of certain rivers and streams which are not readily computable by an electronic computer. The reason certain discharges are not computable by the electronic computer is because the direct stage-discharge relationship has been destroyed by ice forming on the control, by backwater from a tributary downstream, or by a control structure downstream.

As a regular part of the office work, quantities of water diverted for use are also computed. The quantities computed are total monthly acre-feet. The acre-foot quantities are computed from pumping plant efficiency curves which are developed from a series of instantaneous discharge measurements. The electrical power input, the pumping head, and the discharge are recorded simultaneously to compute the efficiency of a pumping plant. This recording of pumping data is done as part of the field work previously mentioned. The office work involved requires the development of the efficiency curve and the computation of the monthly acre-feet by using the monthly electrical power input records.

TABLES

The tables of daily mean discharge and stage herein are presented by the hydrographic region in which they fall. The hydrographic regions are the same used by the State Water Pollution Control Board. These regions shown on Plate I are the North Coastal, San Francisco Bay, Central Valley, and the Lahontan Regions.

Daily Mean Discharge

The streamflow tables are arranged, for each stream or stream system, in downstream order. Stations on a tributary entering between two main stem stations are listed between those stations, and in downstream order on that tributary. A stream gaging station is named from the stream and the nearest post office (Feather River at Yuba City) or well-known landmark (San Joaquin River at Fremont Ford Bridge).

Each stream gaging station has a stage-discharge relationship or rating developed. The rating gives the flow in second-feet for each gage height at the station. When flows at a single station occur in excess of 140 percent of the highest measurement on the rating, the computed daily mean discharges from the electronic computer are shown as estimated. Normally, the rating is fairly permanent where there is a fixed channel and a fixed flow regimen at the station. The rating varies, however, where the bed at the channel is of loose shifting sand, or where aquatic growth builds up in the channel changing the flow regimen.

Where the rating is not permanent and varies periodically, more frequent measurements of discharge are necessary to accurately determine the daily mean discharge.

An automatic water stage recorder is in operation at most of the gaging stations used in this work. The continuous records of water surface elevations at the stations serve three major purposes in the preparation of the data presented in this report. First, the actual surface elevations at two adjacent stations on a stream afford the means of obtaining the water surface elevations at the pumping plants along the stream between those stations. These elevations give the pumping heads, which heads, in turn, become factors in determining the rates of diversion or drainage by pumping plants. Second, the water surface elevation (gage height) is a factor in determining the flow of the stream, in second-feet, passing the station. Third, the gage heights are presented in the stage tables for use in determining flood crests.

All streamflow data reported herein are derived through the use of mechanical, arithmetical, and empirical operations and methods. Since the results are affected by inherent inaccuracies in the procedures and equipment used, it becomes necessary to establish limits of accuracy for which the data are reported. The following is a listing of significant figures used in reporting streamflow data:

1. Daily flows - second-feet

0.0 - 9.9	Tenths
10 - 99	2 significant figures
100 - up	3 significant figures

2. Means - second-feet

0.0 - 99.9	Tenths
100 - 999	3 significant figures
1000 - above	4 significant figures

The water year totals are reported to a maximum of four significant figures.

Daily Mean Gage Heights

Tables of daily mean gage height and crest stages were published prior to 1957 in a report of this department titled "Flood Flows and Stages in Sacramento and Northern San Joaquin Valleys."

At the bottom of the stage tables are shown the major river crests occurring during the Water Year 1960-61. At stations where an individual daily staff gage reading is taken, which is noted at the bottom of each table, the major crests are now shown.

Two types of daily data are presented for the height or stage of water surface:

(1) for streams subject to tidal influences, daily maximum and minimum gage heights; and (2) for those streams beyond tidal influence, daily mean gage height, or an average of one or more daily staff gage or wire-weight gage readings. Of the 133 stations for which daily stages are presented in this report, 28 have computed daily mean flow. These data are included in the streamflow tables.

Gage heights for stage tables are read in the field or computed from recorder charts, and may be reported to either the nearest tenth of a foot or one-hundredth of a foot.

Daily gage heights, in feet, are tabulated for each day of the period November 1 to June 30, 1961. The elevation of the water surface at the gaging station is obtained by adding the gage height readings to the elevation of the gage datum presented in Tables 1, 16, 358, and 371.

Lakes and Reservoirs

Two types of data are presented for lakes and reservoirs: (1) daily content in acre-feet for Shasta, Folsom, Berryessa, and Millerton Lakes; and (2) daily stage in feet for all others. Plate 3 consists of hydrographs of Shasta Lake, Folsom Lake, and Millerton Lake.

Diversions

These tables show the water diverted during the period November 1, 1960 - October 31, 1961. While the major use of water is for agriculture, small amounts that are diverted for municipal and industrial uses are also reported. The amounts of water diverted by pumping were determined by rating the capacity of each diversion pumping plant and collecting data on hours of operation. The amounts of water diverted by gravity (indicated by "Gravity" in column headed "Number and Size of Pump") were determined either by calibrating suitable measuring devices or by rating canals in a manner similar to that used to rate streamflow stations.

Because of the intermittent operation of most diversion facilities, the monthly diversion values are reported in acre-feet to three significant figures. The totals for individual water users and stream reaches are reported to four significant figures.

Summary of Water Supply and Utilization, Sacramento-San Joaquin Delta

The complexity of waterways, tidal action, seepage, and methods of agricultural water use results in hydrologic problems which preclude normal methods of measuring water supply and water utilization in the Sacramento-San Joaquin Delta.

The correlation of water supply and use for the Delta Service Area, divided into uplands and lowlands, is shown in Table 21. The water supply available to the area is determined from 13 gaging stations, listed under "Water Supply" in the table, and from 42 precipitation stations in the area. "Water Utilization" in the same table includes agricultural use, evaporation, exports through the Delta-Mendota and Contra Costa Canals, and diversion for the City of Vallejo. Agricultural use in the uplands is determined by direct measurement of diversions; however, in the lowlands, because it cannot be measured directly, agricultural use is computed by unit values of consumptive use of the various crops, multiplied by the acreages. Unit values of consumptive use were derived from experimental work by the University of California and California Extension Service as reported in Bulletin No. 27 entitled "Variations and Control of Salinity in Sacramento-San Joaquin Delta and Upper San Francisco Bays." Crop acreages are determined by periodic land use surveys. Values used in this report were determined from a survey made in 1955.

Supplementary Tables

The supplementary tables include a description of gaging stations, precipitation data, runoff comparisons, and salinity at selected stations in the Sacramento-San Joaquin Delta.

Gaging Station Description. Tables 1, 22, 351, and 364 provide station descriptions and supplemental current and historical data for each gaging station reported. Each gaging station is referenced to a well established datum plane elevation wherever such datum is known. Some gages are referenced to arbitrarily assumed local datum planes, denoted as "local" in the reference datum column. All gage heights are in feet.

Precipitation. Table 18 presents the monthly precipitation data for the water year for several stations in the Sacramento and San Joaquin Valleys, from Shasta Dam to Fresno. The stations give a broad and general indication of the rainfall on the floor of the Central Valley.

Runoff Comparisons. The relative magnitude of runoff occurring on any one stream during a given year may be shown as the ratio of the runoff of that year with the average runoff of the stream expressed as a percentage. For this report, the average unimpaired runoff is computed for the 50-year period October 1907 through September 1957. Table 19 presents, for the major streams of the Central Valley area, the 1959-60 monthly unimpaired runoff expressed as a percent of the 50-year average monthly unimpaired runoff. Table 20 shows the unimpaired average annual runoff for the same streams and the percentage of the 50-year average unimpaired runoff for each water year from 1919-20 through 1959-60.

Salinity. Table 218 lists the salinity sampling stations within the Sacramento-San Joaquin Delta. The stations are listed beginning with the Golden Gate as zero miles and proceeding upstream through the bay system to the delta area. The salinity samples are taken,

when possible, at four-day intervals, one and one-half hours after high-high tide. The observed concentrations of salinity are given in Table 220. The locations of these stations are shown on Plate 2, "Lines of Annual Maximum Salinity Encroachment." The line of salinity encroachment describes the maximum seasonal encroachment of 1000 parts of chlorides per million parts of water. The lines on the plate show conditions during the current water year and other water years of historical interest.

Miscellaneous Measurements

Table 381 contains tabulations of discharge measurements of streamflow on various streams at locations other than those where continuous recorders are maintained. When the flows as shown here are correlated with flows of nearby streams, an estimate of the runoff can be determined.

DEPARTMENT REPORTS OF BASIC WATER RESOURCES DATA

Reports issued annually by the Department of Water Resources to record basic hydrologic data and to present conditions of water supply include the following:

<u>Bulletin Series No.</u>	<u>Name</u>
23	Surface Water Flow (formerly Sacramento-San Joaquin Water Supervision)
39	Water Supply Conditions in Southern California
65	Quality of Surface Waters in California
66	Quality of Ground Waters in California
77	Ground Water Conditions in Central and Northern California
--	Water Conditions in California (published in February, March, April, and May of each year)

NORTH COASTAL REGION

NORTH COASTAL REGION

Introduction

The North Coastal Region covers the same portion of Northern California as does the North Coastal Water Pollution Control Region 1, and is shown on Plate 1. The stream systems within this region drain the western slopes of the Coast Range north of Marin County, the Klamath Mountains, and a portion of the Cascade Range. Data tabulated in this report show daily mean discharge at stations in the Shasta, Scott, and Trinity River basins.

Streamflow in this area results mostly from surface runoff but is sustained in late spring and early summer by melting snowpack in the eastern portion of the area, and through the summer and early fall by ground water seepage from a thick, absorptive soil mantle.

Though the 1960-61 streamflow conditions described in this report show that the State has undergone its third consecutive year of subnormal runoff conditions, the North Coastal area again reports near normal runoff. Early winter precipitation and runoff were below average but during February and March were heavy enough to bring conditions up to average except in the southerly portion of the area.

Tabular Information

On the following pages data are tabulated for 9 gaging stations for the 1961 water year.

CENTRAL VALLEY REGION

CENTRAL VALLEY REGION

Introduction

The Central Valley Region covers the same portion of Central California as the Central Valley Water Pollution Control Region 5, and is shown on Plate 1. The Central Valley Region contains three separate physiographic areas: the Sacramento River Basin, the San Joaquin Basin, and the Sacramento-San Joaquin Delta. Most of the low-lying areas are highly developed and items of interest are adequate and timely water supply, flood stages, and salinity incursion in the Delta.

Streamflow in the area results from surface runoff, snow pack melt, ground water seepage, and irrigation return flows. All of the major streams in the area have their flow controlled to some degree by reservoirs of which nearly all serve to develop a water supply, with some diverting water for use.

The 1960-61 water year was the third successive dry year and for the Central Valley Region was the third driest year of record. Throughout the area, precipitation was about 75 percent of normal and runoff was 55 percent of normal.

Tabular Information

On the following pages data are tabulated for streamflow stages, salinity, diversions, and supplementary data for the 1961 water year.

* Average unimpaired runoff in thousands of acre-feet computed from the 50 year period October 1907 through September 1957.

a Figures were computed from summations of unimpaired runoff at foothill stations on major tributaries only and do not include runoff from minor tributaries and from the valley floor.

a. Water supply from precipitation has been computed using weighted monthly mean rainfall and the average of the Delta Service Area.
b. Consumptive use in the Delta Lowlands has been computed using monthly unit consumptive use factors for classified vegetation and evaporation, and acreage data obtained through the land use surveys of 1952 and 1955.

		Station located 200 ft. above U. S. Highway 299 Bridge. Tributary to Pit River. Stage-discharge relationship at times affected by ice. (f)	7.57	12/1/60										
40 23 50	123 08 05	BATTLE CREEK NEAR COTTONWOOD	11.9	12/1/60	12800	11.85	2/6/42			OCT 40-DATE	OCT 40-DATE	1940	421.47	USGGS
		Station located 6.3 mi. above mouth, 7.6 mi. E of Cottonwood. Tributary to Sacramento River. From 50 c.f.s. to 90 c.f.s. bypassed station through Coleman Fish Hatchery. Flow regulated by small powerplants and reservoirs above station. Records furnished by USGS. Drainage area is 362 sq. mi. (s)												
40 31 48	122 06 34	BEAR CREEK NEAR MILLVILLE	2910E	12/1/60	2910E	10.18	12/1/60	57820	44430	OCT 59-DATE	AUG 59-DATE	1959	0.00	LOCAL
		Station located below State Highway 44 bridge, 3.7 mi. E of Millville. Tributary to Sacramento River. Recorder installed Aug. 14, 1959. (f)												
39 43 38	121 51 43	BIG CHICO CREEK AT CHICO	695	12/1/60				32310	35770	JAN 56-DATE	JAN 56-DATE	1956	167.88	USED
		Station located 50 ft. above Rose Avenue Highway Bridge, immediately W of Chico. Tributary to Sacramento River. For total flow of Big Chico Creek near Mouth, combine with flow of Lindo Channel near Chico. (f)	7.33	12/1/60										
39 46 35	121 45 10	BIG CHICO CREEK NEAR CHICO	7.2	1/31/61	8260	16.6	12/10/37			MAY 30-DATE	MAY 30-DATE		0.00	LOCAL
		Station located 1.8 mi. above golf clubhouse in Bidwell Park, 7 mi. NE of Chico. Drainage area is 67.9 sq. mi. (s)												
41 34 42	120 37 33	BIG SAGE RESERVOIR NEAR ALTURAS	14.30	4/3/61		24.40	2/27/58			OCT 57-DATE	1957		0.00	LOCAL
		Station located at reservoir control structure, 150 ft. N of Big Sage Dam, 8 mi. NW of Alturas. Maximum gage height listed does not necessarily indicate maximum discharge. (s)												
40 52 18	121 40 58	BURNEY CREEK NEAR BURNEY	427	1/31/61	592E	9.75	1/12/59	35230	29720	APR 58-DATE	APR 58-DATE	1958	0.00	LOCAL
		Station located 300 ft. above county road bridge, 0.4 mi. SW of Burney. Tributary to Pit River. Stage-discharge relationship at times affected by ice. Flow affected by upstream diversion. Drainage area is 67.7 sq. mi. (f)												

 E - Estimated
 (s) - Record of stage published
 d - Irrigation season only
 # - Flood season only

Station located 6.4 mi. SE of Adin. Tributary to Pit River via Ash Creek. Stage-discharge relationship at times affected by ice. (f)															
BUTTE CREEK NEAR CHICO															
39 43 34	121 42 28	NW36 22N 2E		5.1	1/31/61	18700	13.35	12/22/55			NOV 30-DATE	NOV 30-DATE			
Station located 0.7 mi. below Little Butte Creek, 7.5 mi. E of Chico. Flow slightly regulated by storage in Magalia Reservoir. Considerable importations above station from West Branch Feather River via powerplants. Records furn. by USGS. Drainage area is 148 sq. mi. (s)															
BUTTE CREEK NEAR DURHAM															
39 40 37	121 46 38	NW17 21N 2E	3600	7.30	1/31/61	5100	8.65	2/8/60	169000	166400	JAN 58-DATE	JAN 58-DATE	1958	181.01	USED
Station located 0.1 mi. below Ord-Chico Highway bridge, 2.6 mi. NE of Durham. Tributary to Butte Slough. (f)															
BUTTE SLOUGH AT MAWSON BRIDGE															
39 11 14	121 54 28	SW31 16N 1E	10200	53.93	2/4/61		68.9	3/1/40	406200	388600	JAN 39-DATE	NOV 34-MAY 37#	1934	0.00	USED
Station located at West Butt-Meridian Highway bridge, 3.0 mi. N of Meridian. Tributary to Sutter Bypass. Flow affected by gate operation. Flow during summer months is made up almost entirely of return water from lands irrigated by Feather River diversions. During flood periods, Sacramento River water enters Butte Basin above Butte City by bank spill and spill over Moulton and Colusa weirs. (fs)															
BUTTE SLOUGH AT OUTFALL GATES															
39 11 44	121 56 04	NE35 16N 1W							193100	226100	JUN 24-OCT 38d	JUN 24-DATE		0.00	USED
Station located 4.0 mi. E of Colusa, 3.7 mi. N of Meridian. Tributary to Sacramento River. Flow regulated by gravity diverters. These flows, together with flow of Butte Slough at Mawson Bridge and Wadsworth Canal near Sutter are, during the summer months, made up almost entirely of return water from lands irrigated by Feather River diversions. (fs)															
CHEROKEE CANAL NEAR RICHVALE															
39 27 53	121 44 37	NW34 19N 2E		5600E	9.48	2/9/61					JUL 60-DATE	JUL 60-DATE	1960	88.2D	USCGS
Station located on Butte City Road Bridge, 2.1 mi. S of Richvale. Backwater from Cherokee Dam weir, 1.05 mi. below station, at times affects the stage-discharge relationship. Weir has 13 bays and is operated by the Richvale Irrigation District.															
CLEAR CREEK NEAR IGO															
40 30 50	122 31 20	NE27 31N 6W		7.6	1/31/61	24500	13.75	12/21/55			OCT 40-DATE	OCT 40-DATE			
Station located at highway bridge on Redding-Igo road, 1.0 mi. NE of Igo, 8 mi. SW of Redding. Tributary to Sacramento River. Records furn. by USGS. Drainage area is 228 sq. mi. (s)

Station located 0.1 mi. below highway bridge, 1.7 mi. E of College City. Flow is drainage chiefly from lands irrigated by Glenn-Colusa, Knight, Princeton-Godara-Guern, Compton-Dalevan, Makwell, and Yacinto Irrigation Districts. Backwater from Knights Landing Outfall gates at times affects stage-discharge relationship. Maximum gage height listed does not necessarily indicate maximum discharge. Results of measurements listed in supplementary table in report. (s)																
COLUSA BASIN DRAIN AT HIGHWAY 20																
39 11 44	122 03 34	NE34 16N 2W	2530	2/3/61	25400E	51.93	2/21/58		460000	417700	JUN 24-DEC 40 MAY 41-DATE	JUN 24-DEC 40 MAY 41-DATE	1957	1957	37.09 0.00	USED USED
Station located at State Highway 20 bridge, 3.0 mi. W of Colusa. Flow is return water in main drain of Reclamation District 2047, chiefly drainage from irrigation districts. (fs)																
COLUSA BASIN DRAIN AT KNIGHTS LANDING																
38 47 58	121 43 27	SW14 11N 2E				36.8	2/10/42				MAY 24-OCT 39 JAN 40-DATE	MAY 24-OCT 39 JAN 40-DATE	1924		0.00	USED
Station located at Knights Landing Outfall Gates, 0.3 mi. W of Knights Landing. Tributary to Sacramento River. Flow regulated by outfall gates. An undetermined amount of flow is diverted to Yolo Bypass via Ridge Cut at Knights Landing. For total flow to Sacramento, combine with flows of Reclamation District 787 to Colusa Basin Drain. Maximum gage height listed does not indicate maximum discharge. (fs)																
COLUSA WEIR SPILL TO BUTTE BASIN																
39 14 12	121 59 38	SE17 16N 1W	22800	65.19	12/3/60		70.6	3/1/40	125600	213400	JAN 40-DATE#	JAN 35-DATE#	1935		0.00	USED
Station located at N end of weir, 2.0 mi. N of Colusa. Elev. of weir crest is 61.80 ft. U.S.M.D. datum;																
COTTONWOOD CREEK NEAR COTTONWOOD																
40 23 10	122 14 15	NE 7 29N 3W		10.8	1/31/61	52300	15.4	3/1/41			OCT 40-DATE	SEP 40-DATE				
Station located 2 mi. E of Cottonwood, 2.4 mi. above mouth. Tributary to Sacramento River. At times during irrigation season, Cottonwood Creek receives water above station from Sacramento River by way of Anderson-Cottonwood Canal. Records furnished by U.S.G.S. Drainage area is 945 sq. mi. (s)																
DEER CREEK NEAR VINA

See Tisdale Weir Sp411 to Sutter Bypass. Gage heights below weir crest (45.45 ft.) are not tabulated. (s)												
SACRAMENTO RIVER AT VINA BRIDGE												
39 54 34	122 05 31	NE28 24N 2W	84.24	12/1/60	147000	89.42	2/25/58	7030000	APR 45-DATE	1945 1945	100.00 97.15	USED USCGS
Station located 250 ft. above Vina-Corning Highway bridge, 2.6 mi. SW of Vina. (fs)												
SACRAMENTO RIVER BELOW WILKINS SLOUGH												
39 00 35	121 49 25	NE 2 13N 1E	47.4	2/4/61	28900	51.41	2/27/58		APR 31-OCT 39d JAN 39-DATE	1931	0.00	USED
Station located 0.3 mi. below Wilkins Slough pumping plant of Reclamation District 108, 1.3 mi. below Tisdale Weir, 6 mi. SE of Grimes. Maximum discharge of record listed is for period 1938 to date. Records furnished by U.S.G.S. (s)												
SACRAMENTO SLOUGH AT SACRAMENTO RIVER												
38 46 52	121 38 27	SE21 11N 3E	36.1	2/9/60					JUN 24-OCT 39d JAN 40-DATE	APR 45-DEC 46d APR 47-DATE		
Station located 0.5 mi. above mouth, 4.6 mi. SE of Knights Landing. During low flows this represents combined flows of Sutter Bypass and Reclamation District 1500. During High flows (above gage ht. 29.0) the slough is entirely submerged as it lies within the bypass area. Sharp rises in the Sacramento River cause zero or negative flow. (f)

* Carries return water from Colusa Basin along west border of Reclamation Districts 108 and 787 and then discharges to Sacramento River at Mile 34.15R or partial diversion via Knights Landing Ridge Cut.

** Mileage along Colusa Basin Drain from junction with Sacramento River.

a Replaces a 14" unit.

b The 16" unit was installed in 1961.

c New installation in 1961.

d The 14" unit was a temporary installation during 1961

e Formerly listed as Demmer and Bohach.

f Formerly listed as John M. Demmer and Mary R. Bohach.

a Mileage on Butte Creek from junction with Butte Slough at Mile 0.6E.
 b Mileage on Butte Slough from junction with Sacramento River at Mile 04.0L.
 c One 16" unit was a temporary installation during 1961.
 d The 14" unit was a temporary installation during 1961.

e Flow in Butte Slough derived from Butte Creek, is controlled by outfall gates at junction with Sacramento River and is thereby retained in Butte Slough to discharge into East and West Borrow Pits of Sutter Bypass near "Long Bridge." The Outfall Gates are maintained by the Department of Water Resources and are operated cooperatively with the Butte Slough Irrigation Company. See Sutter Bypass Diversion.

- a Milesages on West Borrow Pit are given northerly from drain plant of Reclamation District 1500. Mile 9.15 on West Borrow Pit is opposite Chandler.
- aa Milesages on East Borrow Pit are given northerly or southerly from Chandler.
- b Plant is on main drain canal for Drainage Plant No. 1 that joins East Borrow Pit of Sutter Bypass at Mile 14.4. Figure in parentheses indicates distance along drain from East Borrow Pit.
- c Plant is on drainage canal for Drainage Plant No. 2 that joins East Borrow Pit of Sutter Bypass at Mile 10.0N. Figure in parentheses indicates distance along drain from East Borrow Pit.
- d Plant is on Wadsworth Canal that joins East Borrow Pit of Sutter Bypass at Mile 16.5N. Figure in parentheses

- Indicates distance along canal from West Borrow Pit.
- b Plant is on Fiddle Creek that joins East Borrow Pit of Sutter Bypass at Mile 16.7N. Figure in parentheses indicates distance along creek from East Borrow Pit.
- a Water used for irrigation in Sutter Bypass is mainly Feather River return water which enters East and West Borrow Pits via Butte Creek, Sutter Slough and Wadsworth Canal.
- b Indicates area irrigated is within Bypass.
- c Installed prior to 1961. Not previously listed.
- d Replaces a 7" unit.
- e New installation in 1961.
- f Previously listed as a 6" unit.
- g The 8" unit was a temporary installation during 1961.
- h The 3" unit was a temporary installation during 1961.
- i Previously listed as 20" unit.

* Diversions shown in this table below Mile 7.2 are considered as Delta Uplands Diversions.
 a Formerly listed as T. S. Glide.
 b No Putah Creek water diverted by this pump. Water diverted was water pumped into Putah Creek from Yolo Bypass (West Cut) by pump at Mile 17.1R (1.4).

c This acreage also received an undetermined amount of well water.
 d New installation in 1961.
 e Formerly listed as William H. Royce.
 f Portable unit used at Mile 25.6R and 26.8R.
 g Plant moved to Mile 28.7L.

* Diversions shown in this table below the Woodbridge Gaging Station are considered as Delta Uplands Diversions. Left bank diversions into Reclamation District 348 (below Mile 9.8) and right bank diversions into McCormack-Williamson Tract (below Mile 3.5) are not included since these areas are considered to be within the Delta Lowlands. Tidal effect ceases at about Mile 10.5.
 ** Mile and bank above New Hope Bridge.

a A 5" unit moved from Mile 32.75R in 1961.
 b Formerly listed as a 6" unit.
 c Formerly listed as M. M. Bender.
 d Formerly listed as E. L. Corwin & Son.
 e The 4" pump is a portable unit.

* Diversions shown in this table below the Stockton gaging station are considered as Delta Uplands diversions. Right bank diversions below Mile 2.0 and left bank diversions below Mile 0.7 are not included since they serve areas that are considered to be within the Delta Lowlands. Tidal effect ceases at about Mile 5.0.

•• North Slough - North Slough diverts from Calaveras River at Mile 21.6R. Distance from Calaveras River and bank is shown in parentheses.

8 Mormon Slough - Mormon Slough diverts from Calaveras River at Mile 25.3L, and rejoins the river through Stockton Diverting Canal. Distance from Calaveras River and bank is shown in parentheses.

88 Stockton Diverting Canal - Stockton Diverting Canal diverts from Mormon Slough at Mile 8(13.0) and rejoins the Calaveras River at Mile 5.4L. Distance from Calaveras River and bank is shown in parentheses.

a This diversion dropped due to a cutback in the diversion program. This cutback necessitated the dropping of approximately 50 percent of the diversion points on this stream.

b Formerly listed as a 4" unit.

c Formerly listed as a gravity.

d Formerly listed on Left bank.

e Formerly listed as a 12" unit.

f Formerly listed as Fred Casella.

g Formerly listed as P. W. Leonardini.

h Formerly listed as Eva Hunt.

* Mileage along San Joaquin River from its mouth 4 1/2 miles below Antioch.
 a Plant is located on wellhead slough which joins the San Joaquin River at this mile.
 b Includes an undetermined amount of water returned to the river by spill.
 c Plant is located on Paradise Cut which joins the San Joaquin River at this mile.
 d Formerly listed as Dethlefsen Brothers.
 e Plant moved from Mile 63.0L to Mile 63.3L in 1961.
 f Plant moved from Mile 64.6L to Mile 64.7L in 1961.
 g Plant is located on Old Channel which joins the San Joaquin River at this mile.
 h Replaced an 8" unit in May 1961.
 i Plant is located on intake canal which joins the San Joaquin River at this mile.
 j Formerly listed as L. Ball.
 k Replaced a 6" gas unit in July 1961.
 m Formerly listed as Tony M. Cardoza.
 n Replaced a 6" unit in July 1961.

* Figures represent North Townships, East Ranges and sections. Letters represent the 1/4 - 1/4 sections which are lettered from A through R excluding I and O, similar to the numbering of sections within a township.
a Formerly listed as Lawrence Jimenez.
b Includes 452 acre-feet received by sub-irrigation.
c A 12" unit installed in 1961.
d Includes an undetermined amount of spill.

e New installation in 1961.
f Includes an undetermined amount of Marsh Creek water.
g Not previously reported: 1959=177 acre-feet, 1960=202 acre-feet.
h Includes undetermined amount of drain water.
i Diversion in 1961 was all controlled drainage water.
j Estimated consumptive use on lands in the Delta Uplands considered as sub-irrigated from tidal channels during 1961 without a specific point of diversion.

- ** West Stanislaus Irrigation District Canal. The intake canal joins the San Joaquin River at mile 91.8L. Distance from the river and the bank is shown in parentheses.
- * Mileage along San Joaquin River from its mouth 4.5 miles below Antioch.
- a Replaces a 10" Unit.
- b Includes an undetermined amount of water returned to river by spill.
- c Formerly listed as El Solyo Water Company.
- d The 16" Unit was installed in 1961.

- e Pumping plant is located on old channel which joins the San Joaquin River at this mile.
- f Formerly listed as L. S. Crane.
- g Formerly listed as Earl Wheatly.
- h A 10" Unit was removed in 1961.
- i One 8" Unit was installed in 1961.
- j A 4" Unit was removed in 1961.

Monthly use in per cent of seasonal			11.9	18.2	18.3	14.6	8.2	11.2	15.2	2.3						

a Record available from U.S.G.S.
 b Moved 1.05 miles upstream. Title prior to 1961 was Tule River at Worth Bridge.
 c Flow measured at gaging station on Campbell-Moreland Ditch located approximately 2600 feet below head.
 d 1764 acre-feet of water flowed into Porter Slough as follows: November-441, December-278, January-186, February-329, March-87, April-139, May-303, and June-1.
 e Flow measured at gaging station on Porter Slough Ditch located approximately 150 feet below head.
 f Flow measured at gaging station on Vandalia Ditch located approximately 1000 feet below head. The greater portion of this water was used to recharge Vandalia Irrigation District well field.

g Flow measured at gaging station on Poplar Ditch approximately 4750 feet below head.
 h Flow measured at gaging station on Hubbs-Miner Ditch located approximately 3400 feet below head. Includes an undetermined amount of water diverted by the Gilliam-McGee Ditch.
 i Flow measured at gaging station on Rhodes-Fine Ditch located approximately 3100 feet below head.
 j Flow measured at gaging station on Woods Central Ditch located approximately 100 feet below head.
 k This Ditch has been abandoned.
 * Mileage downstream from junction with South Fork Tule River.

* Data for Madera and Frisant Kern Canals furnished by USBR, and other data furnished by individual irrigation districts.
 a An additional 123,325 acre-feet of water was pumped from wells.
 b Of this acreage, 725 was double cropped. Does not include an undetermined amount of riparian water users acreage.
 c An additional 189,196 acre-feet of water was pumped from wells.
 d Of this acreage, 17,847 was double cropped.
 e An additional 73,300 acre-feet of water was pumped from wells.
 f Of this acreage, 10,747 was double cropped.
 g An additional 5,375 acre-feet of water was pumped from wells.

h Of this acreage, 207 was double cropped.
 i Of this acreage, 216 was double cropped.
 j Of this acreage, 935 was double cropped.
 k This acreage also received 28,963 acre-feet of water from wells and controlled drainage.
 m This acreage also received an undetermined amount of well water, and an undetermined amount of controlled drainage water from Oakdale Irrigation District. Of this acreage, 3,975 was double cropped. Includes 1,413 acres served by subirrigation.
 n Data furnished by U. S. Bureau of Reclamation. These quantities are delivered from Polson and Nimbus reservoirs.

TABLE 223
DESCRIPTION OF SALINITY OBSERVATION STATIONS
1960-61 Water Year

Station	Miles from Golden Gate (a)	Time Interval (b)		Location
		Hours	Min.	
SAN FRANCISCO, SAN PABLO, AND SUISUN BAYS				
Point Pinole	19.0	2	50	South shore of San Pablo Bay, at Point Pinole on wharf of Atlas Powder Company.
Crockett	27.7	3	30	West end of Carquinez Strait, south shore, 0.2 mile east of Carquinez Bridge on wharf of C. and H. Sugar Refining Corporation.
Benicia	32.5	3	50	East end of Carquinez Strait, north shore, 1.1 mile west of Southern Pacific Company railroad bridge at Benicia Arsenal.
Martinez	32.7	3	50	East end of Carquinez Strait, south shore, 1.0 mile west of Southern Pacific Company railroad bridge at Municipal Ferry Slip. (Bulls Head Point.)
West Suisun	37.0	4	10	West end of Suisun Bay, north shore, 2.5 miles northeast of Southern Pacific railroad bridge at service pier of U. S. Maritime Commission, Reserve Fleet mooring area.
Innisfail Ferry	47.3	4	50	Montezuma Slough, about one mile east of junction with Cutoff Slough near north end of Grizzly Island.
Port Chicago	41.0	4	20	South shore of Suisun Bay at U. S. Naval ammunition loading wharf below Port Chicago.
Spoonbill Creek	48.9	5	05	At Sacramento Northern Railroad crossing.
Pittsburg	48.0	5	00	East end of Suisun Bay, south shore, at Pittsburg Yacht Harbor.
SACRAMENTO RIVER DELTA				
Collinsville	50.8	5	25	Sacramento River, north bank at junction with San Joaquin River.
Emmaton	57.6	5	45	Sacramento River, south bank, 5.9 miles downstream from Rio Vista Bridge.
Threemile Slough Bridge	60.0	5	55	Threemile Slough, at State Highway 24 bridge, near junction with Sacramento River.
Rio Vista Bridge	63.5	6	05	Sacramento River, at highway bridge near northerly limits of Rio Vista.
Isleton Bridge	68.7	6	30	Sacramento River, at highway bridge 1.0 mile upstream from Isleton.
SAN JOAQUIN RIVER DELTA				
Antioch	54.9	5	55	San Joaquin River at City Water Works pumping plant.
Antioch Bridge	58.2	6	10	South shore San Joaquin River at Antioch Bridge.
Jersey Island	61.4	6	20	San Joaquin River, left bank, one mile below mouth of False River.
Threemile Slough	64.2	6	30	Threemile Slough, west bank, at junction of slough with the San Joaquin River.
Oulton Point	67.2	6	40	San Joaquin River, right bank, three miles upstream from junction of Threemile Slough.
San Andreas Landing	70.3	6	55	San Joaquin River, right bank, one mile below the mouth of the Mokelumne River.
Opposite Central Landing	72.0	7	00	Mokelumne River on Andrus Island directly opposite Central Landing on Bouldin Island.
Dutch Slough	73.0	7	05	At Bethel Island Bridge.
East Contra Costa I. D.	86.7	8	20	Indian Slough at East Contra Costa Irrigation District pumping plant.
Clifton Court Ferry	94.2	9	10	Old River, right bank, 1.5 miles below junction with Grant Line Canal.
Mosadale B idge	108.5	10	50	San Joaquin River at U. S. 50 Highway crossing about three miles southwest of Lathrop.
Vernalis	127.0	11	00	San Joaquin River at Durham Ferry Bridge above tidal influence.

- a Mileage measured to station along main channel. For stations off the main channel, the mileage shown is the same distance along the main channel to a point whereon the time of the occurrence of the tidal phase is the same as that of the observation station.
- b Time interval between high tide at Golden Gate and time for taking samples at station.

TABLE 22-

* Ocean water contains approximately 18,200 parts per million.

a For location see Plate 2.

b Releases of stored water from Shasta Lake commenced in 1944.

c Releases of stored water from Folsom Reservoir commenced in 1956.

d Average taken as a mean annual unimpaired flow at foothill stations of major tributaries for 50-year period October 1907 through September 1957.

e No record. Unable to obtain local observer.

f Station located above tidal action.

LAHONTAN REGION

LAHONTAN REGION

Introduction

The Lahontan Region covers the same portion of eastern California as does the Lahontan Water Pollution Control Region 6. This report presents data from that portion of the region north of the Mono divide. The principle stream systems in the area rise on the eastern slopes of the Sierra Nevada and the Cascade Range and drain into inland lakes or sinks. Data tabulated in this report show daily mean discharge at stations in Surprise Valley and Eagle Lake, Honey Lake, and Lake Tahoe basins.

Storms crossing the mountains along the western edge of the area lose much of their moisture before entering the area and precipitation ranges from 50 inches at the higher elevations to less than 10 inches along the eastern edge. Streamflow results from surface runoff and snowmelt principally at the higher elevations.

The 1960-61 water year was the third successive dry year statewide. In the Lahontan Region precipitation was less than 70 percent of normal and runoff about 50 percent, the year being the driest since 1931.

Tabular Information

On the following pages data are tabulated for 11 gaging stations for the 1961 water year.

LATITUDE	LOCATION		1960-61 WATER YEAR			MAXIMUM DISCHARGE			OF RECORD			TOTAL DISCHARGE		PERIOD OF RECORD		DATUM OF GAGE

SAN FRANCISCO BAY REGION

SAN FRANCISCO BAY REGION

Introduction

The San Francisco Bay Region covers the same portion of coastal California as does the San Francisco Bay Water Pollution Control Region 2. Stream systems in this region drain the western slopes of the coastal ranges and includes the mouth of the Sacramento River. Streamflow in this area results from surface runoff and is sustained through the summer by ground water seepage from the soil mantle.

The 1960-61 water year was the third consecutive year of subnormal runoff. In this region, it was the third driest year of record. Precipitation in the area was about 70 percent and runoff was about 15 percent of normal.

Tabular Information

On the following pages data are tabulated for two gaging stations and daily maximum and minimum tides on Suisun Bay at Benicia and Sacramento River at Collinsville for the 1961 water year.

TABLE 371

TABLE 381

STREAMFLOW MEASUREMENTS AT MISCELLANEOUS SITES

Measurement of streamflow at points other than gaging stations or at points where flow has not been computed are listed in the following table.

Stream	Location	Date	Measurements	
			Gage Height (ft.)	Discharge (cfs)
<u>Northern Branch</u>				
Antelope Creek	at Highway 99E Bridge	1-13-61	1.72	3.01
Deer Creek	at Highway 99E Bridge	1-13-61	2.81	118
Thomea Creek	at Highway 99W Bridge	4-17-61	2.81	229
Pine Creek	at Highway 32	10-24-60	2.25	(Est.)10.0
Sacramento River	at Middle Stake Fish Weir	12-29-60	1.32	3,982
		5-8-61	2.68	7,517
Bear Creek	above Elder Creek	12-29-60	4.64	5,074
		5-8-61	6.29	9,275
South Fork Pit River Diversion	near Parkville School	10-19-60	3.21	4.85
		2-17-61	4.10	303
Pit River	near Pittville	11-22-60	1.81	8.88
		2-20-61	2.32	26.7
		3-15-61	1.44	3.00
		3-30-61	2.29	26.0
Sacramento River	at Ball's Ferry	10-18-60	2.62	42.0
		11-15-60	3.10	125
		12-20-60	4.09	475
		1-19-61	3.17	138
		2-16-61	5.38	1,377
		3-28-61	4.88	1,006
		4-17-61	2.73	55.9
		5-17-61	2.61	28.1
		7-24-61	2.22	3.58
		10-20-60	2.36	5,265
		11-29-60	2.07	4,584
		12-27-60	1.85	4,296
		3-6-61	5.03	13,741
near Redding		10-21-60	42.82	5,269
		11-29-60	42.29	4,054
		12-27-60	42.00	3,317
		3-6-61	45.13	12,306
<u>Delta Branch</u>				
Bear River (a)	near Colfax NW $\frac{1}{4}$, Sec. 27, T15N, R9E	10-19-60	4.75	19.8
		12-15-60	5.18	57.8
		1-11-61	4.48	6.07
		2-17-61	4.59	3.84
		3-2-61	4.55	4.08
Walthall Slough (b)	NW $\frac{1}{4}$, Sec. 14, T2S, R6E	10-28-60	2.74	17.4
		11-25-60	2.71	10.6
		12-22-60	2.32	2.35
		1-20-61	2.51	4.48
		2-16-61	2.67	9.56
		3-17-61	2.65	12.1
		4-14-61	2.72	15.3
		5-12-61	3.08	12.2
		6-9-61	2.89	21.3
		7-7-61	3.04	15.7
		8-2-61	2.97	15.3
		8-28-61	3.06	12.1
		<u>San Joaquin Valley Branch</u>		
Chowchilla River	near Raymond	1-26-61	568.97	25.8
		1-27-61	569.80	75.0
		2-24-61	568.60	13.7
		3-23-61	568.82	18.1
		4-25-61	568.78	16.3
		5-24-61	568.22	5.2

(a) Recorder installation.

(b) Measurement of Walthall Slough flow to Weatherbee Lake. This includes the flow of South San Joaquin Irrigation District Drain 11 near Manteca, and gage heights shown are at that recorder station.
