#### FOREWORD

This report presents hydrologic data for the hydrographic regions of Northern and Central California. These data were collected by the four area branches of the department:

Northern, Bay Area, Delta, and San Joaquin Valley. Each branch uses standard hydrographic procedures in the collection of these data.

The data collected by the department and presented in this report are augmented by a network of approximately 400 stream gaging stations, whose records are published by the U.S. Geological Survey in the annual water supply paper.

The reporting period is the Water Year (October 1 to September 30) for streamflow and stage data, and the Diversion Year (November 1 to October 30) for the diversion data contained herein.

#### DEPARTMENT OF WATER RESOURCES

P.O. BOX 388 SACRAMENTO

July 27, 1964

Honorable Edmund G. Brown, Governor, and Members of the Legislature of the State of California

Gentlemen:

I have the honor to transmit herewith Bulletin No. 23-62, "Surface Water Flow for 1962." This report is a continuation of the annual series which commenced in 1924 and contains basic data of water flow, diversions, stream stages, and maximum and minimum tides. Although the majority of the material pertains to the Sacramento and San Joaquin Rivers and their tributaries, the data are presented on a regional basis in accordance with the subdivision of the State into hydrographic areas.

The data presented in this report covers a year of near normal runoff. However, the distribution of the runoff was not normal with heavy concentrations in February and April, and the summer months producing flows below normal.

Sincerely yours,

Main 9. Louis

Director

#### Acknowledgments

Cooperation and assistance have been received by the department in the collection of these data from various public and private agencies. This department is grateful to those agencies and appreciates this opportunity to acknowledge their help.

The United States Department of the Interior, Geological Survey, and Bureau of Reclamation, furnished stream stage and flow data and data on the reservoirs of the Central Valley Project, respectively. The United States Corps of Engineers, Department of the Army, has made available streamflow data for certain San Joaquin Valley streams.

The Pacific Gas and Electric Company, the Sacramento Municipal Utility District, and the Modesto and Turlock Irrigation Districts have furnished a large number of electric power consumption records for computation of the quantity of water pumped from streams.

The City of San Francisco Public Utilities Commission has assisted in the collection of other hydrologic data presented in this report.

#### INTRODUCTION

This report presents surface water data for the Water Year 1962 which is from October 1, 1961 to September 30, 1962. The data presented here consists of stream gaging station descriptions, streamflow quantities, stream stage tables, diversion quantities, and contents of reservoirs.

Stream gaging station descriptions are presented with the historic maximum discharge and are shown with the discharge tables. Written detailed locations of the gaging stations and other important data on the length of record and datum of gage is also presented.

Quantities of daily mean discharge for most stations shown here are computed by an electronic computer which was first used extensively for this purpose in the 1961 report. The gage height data is extracted from the standard recorder chart by a semiautomatic chart reading machine and put into machine language. The gage height data are fed into the computer simultaneously with rating data and daily mean discharges, total monthly acre-feet, and instantaneous maximum and minimum discharges are computed. The data are then tabulated by machine for direct publication into this report. Those gaging stations presented here which are affected by a backwater condition are not adaptable to computation by machine method, and are computed manually by standard methods.

Daily mean stage tables of regular and tide affected streams are shown here. These daily mean gage heights are computed by the electronic computer, as mentioned above. The gage height data are to the nearest one-hundredth of a foot, and the major crests for the year are shown.

Quantities of water diverted for use are shown as monthly total acre-feet and total acre-feet diverted for a certain reach of stream. In the San Joaquin Valley, diversions averaging less than 200 acre-feet for the last three years were not measured.

#### Accretions to Streamflow

There are large quantities of accretions to the flows of the streams and channels in their courses across the valley floors. These accretions are of major importance as available irrigation supplies. They are made up of flows from scores of small surface drains, and other flows such as from minor ephemeral streams, from seepage and return of percolated irrigation water, and from escaping underground water normally present as the result of percolated rainfall on the valley floor. The amount of total accretion along any stream reach is the summation of amounts of measured drains plus unmeasured accretions.

Because accretions are not a measured quantity, but rather the result of subtracting measured upstream flow from the flow at a station downstream, they contain all the errors of measured flow involved. For this reason, figures of accretions have not been included in this report.

"Report of Sacramento-San Joaquin Water Supervision" was published annually from 1924 through 1955. Data pertinent to that area is now included as a part of this publication.

Da'a form rly app aring in "Flood Flows and Stages in Sacramento and Northern San Joaquin Valleys," published from 1913 through 1956, are also included as a part of this bulletin.

The objective of this report is to bring together, in a permanent and usable form, all surface flow data gathered by the Department of Water Resources during the 1962 water year. Other relevant data are added for the convenience of the user.

#### Definitions of Terms

A list of definitions of terms as used herein follows:

Second-foot or cubic foot per second is the unit rate of discharge of water. It is a cubic foot of water passing a given point in one second.

Acre-foot is the quantity of water required to cover one acre to a depth of one foot. It is equivalent to 43,560 cubic feet or 325,850 gallons.

<u>Drainage area</u> of a stream at a specified location is that area, measured in a horizontal plane, which is enclosed by a drainage divide.

Unimpaired runoff is the flow that would occur naturally at a point in a stream if there were: (1) no upstream controls such as dams and reservoirs; (2) no artificial diversions or accretions; and (3) no changes in ground water storage resulting from development. Unimpaired flow is computed from measured runoff by allowing for man-made changes in natural conditions.

Water Year is the 12-month period from October 1 of any year through September 30 of the subsequent year, and is designated by the calendar year in which it ends.

Consumptive use is the water transpired, evaporated, and used in promoting vegetative growth plus the water evaporated from adjacent soil and water surfaces.

#### Scope

The work of the Department of Water Resources is concerned with gathering basic data relating to water supply and utilization. In addition to the collection of data on operational water supply, the department is actively engaged in the collection of hydrologic water supply data to augment the base network of the United States Geological Survey. The work consists of field measurements and observations and office computations to determine the daily or monthly quantities of streamflow and diversions.

The field activities include the construction and maintenance of streamflow gaging stations, and the measurements of (1) flow in streams and drainage channels, (2) the amounts of water returned to natural channels through drainage plants or gravity drains, and (3) the amounts of water diverted for use by each water user. The field work also includes the recording of the diversions and acreages irrigated by the large eastside irrigation districts
(Modesto, Merced, Oakdale, South San Joaquin, and Turlock), and the diversions and deliveries by the canals of the Central Valley Project.

The office work is comprised of the preparation of hydrographic data for computation by machine methods. This work consists of developing a rating curve for each stream flow station from a series of instantaneous discharge measurements, and a related formula of the curve. The formula is written in electronic computer language as rating data for computation as previously mentioned.

The office work also includes the manual computation and compilation of the discharge of certain rivers and streams which are not readily computable by an electronic computer. The reason certain discharges are not computable by the electronic computer is because the direct stage-discharge relationship has been destroyed by ice forming on the control, by backwater from a tributary downstream, or by a control structure downstream.

As a regular part of the office work, quantities of water diverted for use are also computed. The quantities computed are total monthly acre-feet. The acre-foot quantities are computed from pumping plant efficiency curves which are developed from a series of instantaneous discharge measurements. The electrical power input, the pumping head, and the discharge are recorded simultaneously to compute the efficiency of a pumping plant. This recording of pumping data is done as part of the field work previously mentioned. The office work involved requires the development of the efficiency curve and the computation of the monthly acre-feet by using the monthly electrical power input records.

#### TABLES

The tables of daily mean discharge and stage herein are presented by the hydrographic region in which they fall. The hydrographic regions are the same used by the State Water Pollution Control Board. These regions shown on Plate I are the North Coastal, San Francisco Bay, Central Valley, and the Lahontan Regions.

Data for selected stations are received from other agencies and presented herein. The data are checked and published as received.

#### Daily Mean Discharge

The streamflow tables are arranged, for each stream or stream system, in downstream order. Stations on a tributary entering between two main stem stations are listed between those stations, and in downstream order on that tributary. A stream gaging station is named from the stream and the nearest post office (Feather River at Yuba City) or well-known landmark (San Joaquin River at Fremont Ford Bridge).

Each stream gaging station has a stage-discharge relationship of rating developed. The rating gives the flow in second-feet for each gage height at the station. When flows at a single station occur in excess of 140 percent of the highest measurement on the rating, the computed daily mean discharges from the electronic computer are shown as estimated. Normally, the rating is fairly permanent where there is a fixed channel and a fixed flow regimen at the station. The rating varies, however, where the bed at the channel is of loose shifting sand, or where aquatic growth builds up in the channel changing the flow regimen.

Where the rating is not permanent and varies periodically, more frequent measurements of discharge are necessary to accurately determine the daily mean discharge.

An automatic water stage recorder is operated at most of the gaging stations presented in this report. The continuous records of water surface elevations at the stations serve three major purposes in the preparation of the data presented in this report. First, the actual surface elevations at two adjacent stations on a stream afford the means of obtaining the water surface elevations at the pumping plants along the stream between those stations. These elevations give the pumping heads, which in turn become factors in determining the rates of diversion or drainage of pumping plants. Second, the water surface elevation (gage height) is a factor in determining the flow of the stream, in second-feet, passing the station. Third, the gage heights are presented in the stage tables for use in determining flood crests.

At the bottom of each table of flow is a description of the gaging station including latitude and longitude; township, range, and section; written location description; maximum discharge of record; period of record; and the datum of gage.

All streamflow data reported herein are derived through the use of mechanical, arithmetical, and empirical operations and methods. Since the results are affected by inherent

inaccuracies in the procedures and equipment used, it becomes necessary to establish limits of accuracy for which the data are reported. The following is a listing of significant figures used in reporting streamflow data:

1. Daily flows - second-feet

0.0 - 9.9 Tenths 10 - 99 2 significant figures 100 - up 3 significant figures

2. Means - second-feet
0.0 - 99.9 Tenths
100 - 999 3 significant figures
1000 - above 4 significant figures

The water year totals are reported to a maximum of four significant figures.

#### Daily Mean Gage Heights

Tables of daily mean gage height and crest stages were published prior to 1957 in a report of this department titled "Flood Flows and Stages in Sacramento and Northern San Joaquin Valleys."

At the bottom of the stage tables are shown the major river crests occurring during the Water Year 1961-62. At stations where an individual daily staff gage reading is taken, which is noted at the bottom of each table, the major crests are not shown.

Two types of daily data are presented for the height or stage of water surface: (1) for streams subject to tidal influences, daily maximum and minimum gage heights; and (2) for those streams beyond tidal influence, daily mean gage height, or an average of one or more daily staff gage or wire-weight gage readings.

Gage heights for stage tables are read in the field or electronically computed from recorder charts, and may be reported to either the nearest tenth or one-hundredth of a foot.

Daily gage heights, in feet, are tabulated for each day of the 1962 Water Year. The elevation of the water surface at the gaging station is obtained by adding the gage height readings to the elevation of the gage datum presented in the description at the bottom of each table.

#### Lakes and Reservoirs

Two types of data are presented for lakes and reservoirs: (1) daily content in acre-feet for Shasta, Folsom, Berryessa, and Millerton Lakes; and (2) daily stage in feet for all others. Plate 3 consists of hydrographs of Shasta Lake, Folsom Lake, and Millerton Lake.

#### Diversions

These tables show the water diverted during the period November 1, 1961 - October 31, 1962. While the major use of water is for agriculture, small amounts that are diverted for municipal and industrial uses are also reported in the Sacramento Valley. In the San Joaquin Valley, diversions are shown for only the larger users. Along the Stanislaus, Tuolumne, and Merced River, and the San Joaquin River between Vernalis and Friant, and Dry Creek diversions averaging less than 200 acre-feet per year for the last three years were not measured. The diversions that were dropped from the measurement program accounted for only about five percent of the total quantity of water diverted.

The amounts of water liverted by pumping were determined by rather the capacity of each diversion pumping plant and collecting data on hours of operation. The amounts of water diverted by gravity (indicated by "Gravity" in column headed "Number and Size of Pump") were determined either by calibrating suitable measuring devices or by rating canals in a manner similar to that used to rate streamflow stations.

Because of the intermittent operation of most diversion facilities, the monthly diversion values are reported in acre-feet to three significant figures. The totals for individual water users and stream reaches are reported to four significant figures.

#### Summary of Water Supply and Utilization, Sacramento-San Joaquin Delta

The complexity of waterways, tidal action, seepage, and methods of agricultural water use results in hydrologic problems which preclude normal methods of measuring water supply and water utilization in the Sacramento-San Joaquin Delta.

The correlation of water supply and use for the Delta Service Area, divided into uplands and lowlands, is shown in Table 13. The water supply available to the area is determined from 13 gaging stations, listed under "Water Supply" in the table, and from 42 precipitation stations in the area. "Water Utilization" in the same table includes agricultural use, evaporation, exports through the Delta-Mendota and Contra Costa Canals, and diversions for the City of Vallejo. Agricultural use in the uplands is determined by direct measurement of diversions; however, in the lowlands, because it cannot be measured directly, agricultural use is computed by unit values of consumptive use of the various crops, multiplied by the acreages. Unit values of consumptive use were derived from experimental work by the University of California and California Extension Service as reported in Bulletin No. 27 entitled "Variations and Control of Salinity in Sacramento-San Joaquin Delta and Upper San Francisco Bays." Crop acreages are determined by periodic land use surveys. Values used in this report were determined from a survey made in 1955.

#### Supplementary Tables

The supplementary tables include precipitation data and runoff comparisons.

<u>Precipitation</u>. Table 10 presents the monthly precipitation data for the water year for several stations in the Sacramento and San Joaquin Valleys, from Shasta Dam to Fresno. The stations give a broad and general indication of the rainfall on the floor of the Central Valley.

Runoff Comparisons. The relative magnitude of runoff occurring on any one stream during a given year may be shown as the ratio of the runoff of that year with the average runoff of the stream expressed as a percentage. For this report, the average unimpaired runoff is computed for the 50 -year period October 1007 through September 1057. Table 11 presents, for the major streams of the Central Valley area, the 1061-60 monthly unimpaired runoff expressed is a percent of the 50-year eventhly unimpaired runoff. Table 12 shows the arimpalied to runoff for the lamb streams and the percentage of the 50-year average unique to a runoff for each union for the lamb streams and the percentage of the 50-year average unique to a runoff for each union for the lamb streams and the percentage of the 50-year average unique to a runoff for each union for the lamb streams and the percentage of the 50-year average.

Salinity. Data of salinity is not shown in this report as in the past, but it is now included in Bulletin No. 65-62, "Quality of Surface Water in California, 1962."

#### Miscellaneous Measurements

Table 368 contains tabulations of discharge measurements of streamflow on various streams at locations other than those where continuous recorders are maintained. When the flows as shown here are correlated with flows of nearby streams, an estimate of the runoff can be determined.

#### DEPARTMENT REPORTS OF BASIC WATER RESOURCES DATA

Reports issued annually by the Department of Water Resources to record basic hydrologic data and to present conditions of water supply include the following:

Bulletin Series No.	<u>Name</u>
23	Surface Water Flow (formerly Sacramento-San Joaquin Water Supervision)
39	Water Supply Conditions in Southern California
65	Quality of Surface Waters in California
66	Quality of Ground Waters in California
77	Ground Water Conditions in Central and Northern California
	Water Conditions in California (published in February, March, April, and May of each year)

### NORTH COASTAL REGION

#### NORTH COASTAL REGION

#### Introduction

The North Coastal Region covers the same portion of Northern California as does the North Coastal Water Pollution Control Region 1, and is shown on Plate 1. The stream systems within this region drain the western slopes of the Coast Range north of Marin County, the Klamath Mountains, and a portion of the Cascade Range. Data tabulated in this report show daily mean discharge at stations in the Shasta, Scott, and Trinity River basins.

Streamflow in this area results mostly from surface runoff but is sustained in late spring and early summer by melting snowpack in the eastern portion of the area, and through the summer and early fall by ground water seepage from a thick, absorptive soil mantle.

The 1961-62 streamflow data presented in this report represent conditions of runoff which are generally good, a great improvement over conditions of the past three years.

The North Coastal area presents records of flow which are about 80 percent of normal.

#### Tabular Information

On the following pages, data are tabulated for gaging stations for the 1962 water year.

Station located 30 ft. above Hayfork-Douglas City Highway bridge, 2 mi. E. of Hayfork. Tributary to South Fork Trinity River via Hayfork Creek. Flow influenced by upstream diversion dam of City of Hayfork. Drainage area is 27.3 sq. mi.

# CENTRAL VALLEY REGION

#### CENTRAL VALLEY REGION

### Introduction

The Central Valley Region covers the same portion of Central California as the Central Valley Water Pollution Control Region 5, and is shown on Plate 1. The Central Valley Region contains three separate physiographic areas: the Sacramento River Basin, the San Joaquin Basin, and the Sacramento-San Joaquin Delta. Most of the low-lying areas are highly developed and items of interest are adequate and timely water supply, flood stages, and maximum and minimum tides in the Delta.

Streamflow in the area results from surface runoff, snow-pack melt, ground water seepage, and irrigation return flows. All of the major streams in the area have their flow controlled to some degree by reservoirs of which nearly all serve to develop a water supply, with some diverting water for use.

The 1961-62 water year was slightly below normal for the Central Valley Region. This was the first near normal year in the last four years, with the runoff about 95 percent of normal.

### Tabular Information

On the following pages data are tabulated for streamflow stages, tides, diversions, and supplementary data for the 1962 water year.

Average unimpaired runoff in thousands of acre-feet computed from the 50-year peri 1 (ctober 1907 through September 1957.
 Pigures were computed from aummations of unimpaired runoff at foothill stations on major tributaries only and do not include runoff from minor tributaries and from valley floor.

a Water supply from precipitation has been computed using weighted monthly mean rainfall and the acreage of the Delta Service Area.

b Consumptive use in the Delta Lowlands has been computed using monthly unit consumptive use factors for classified vegetation and evaporation, and acreage data obtained through the land use surveys of 1952 and 1955.

Station located at county road bridge, 5 mi. W. of Alturas. Stage-discharge relationship at times affected by temporary diversion dam approximately 3 mi. below station and also by ice. During periods of backwater affect by dam, flow listed is not considered to have the same degree of accuracy as other records published in this report. Flow is regulated by many small reservoirs.

Station located in Shasta Dam, 2 mi. below Squaw Creek, 9.5 mi. N. of Redding. Dsable capacity, 4,377,000 acre feet between elevations 737.75 and 1,065.0 ft. above mean see level. Not available for release, 115,700 acre feet. Inflow to Shasta Lake takes into account chan, in storage, release, spill, precipitation, and evaporation, and is representative of the natural flow which would pass the dam eite if the dam had not been constructed. Period of record for computed inflow is shown under period of record for discharge. Period of record for daily content is shown under period of record for stage. Records furnished by U.S.B.R. Drainage area, excluding Goose Lake Basin, is 6,665 sq. mi. Usable capacity, 4,377,000 acre feet between elevations 00 acre feet. Inflow to Shasta Lake takes into account change

Station located 4.0 mi. E. of Colusa, 3.7 mi. N. of Meridian. Tributary to Sacramento River. Flow regulated by gravity culverts. These flows, together with flow of Butte Slough at Mawson Bridge and Wadsworth Canal at Butte House Road are, during the summer months, made up almost entirely of return water from lands irrigated by Feather River diversions.

8 - Irrigation season only

Station located at West Butte-Meridian Highway bridge, 3.0 mi. N. of Meridian. Tributary to Sutter Bypass. Flow affected by gate operation. Flow during summer months is made up almost entirely of return water from lands irrigated by Feather River diversions. During flood periods, Sacramento River water enters Butte Basin above Butte City by bank spill and spill over Moulton and Colusa Weirs.

# - Flood season only

Station located W. of north end of weir, 5.0 mi. SE of Orimes. See Sacramento River at Tisdale Weir for stage records. Elevation of weir crest is 45.45 ft. U.S.E.D. datum; length of crest is 1,155 ft. Backwater from Sutter Bypass at times affects stage-discharge relationship. Maximum gage height listed does not necessarily indicate maximum discharge.

# - Flood season only

Station located at Knights Landing Outfall Cates, 0.3 mi. W. of Knights Landing. Tributary to Sacramento River. Flow regulated by outfall gates. An undetermined amount of flow is diverted to Yolo Eypasa via Ridge Cut at Knights Landing. For total flow to Sacramento, combine with flows of Reclamation District 787 to Colusa Basin Drain. Maximum gage height listed does not indicate maximum discharge.

8 - Irrigatioo season only

Station located 0.5 mi. above mouth, 4.6 mi. SE of Knights Landing. During low flows this represents combined flows of Sutter Bypass and Reclamation District 1500. During high flows (above gage height 29.0+) the slough is entirely submerged as it lies within the bypass area. Sharp rises in the Sacramento River cause zero or negative flow.

8 - Irrigation season only

Station located approx. 4 mi. S of Yuba City. Flow partly regulated by reservoirs and power plants. High flows rated by means of simultaneous current meter measurements of Yuba River near Marysville and Feather River at Yuba City. Record listed is not considered to have the same degree of sccuracy as other records published in this report. Drainags area is 5,343 sq. mi.

8 - Irrigation sesson only # - Flood season only

Station located 0.7 mi. below So. Fork American River, 2.3 mi. NE of Folsom. Records furn. by USBR. Drainage area is 1,875 eq. mi.

Polsom Reaervoir has a usable capacity of 1,000,000 ac. ft. between elevations. 205.5 and 466.0 ft. above mean sea level, practically all of which is available for release. Spillway design flood pool elevation is 475.4 ft. (capacity 1,120,000 ac. ft.)

Computed inflow takes into account change in storage, release, spill, precipitation, and evaporation, and is representative of the natural flow which would pass the damsite if the dam had not been constructed. Period of record is shown under period of record for discharge.

Station located at Boyce Orchard, 2.7 mi. E of Winters.

Note: Due to the lack of high water measurements during 1961-62, and the changing channel conditions at this station during this period, high flows shown were estimated from an extension of a log-log rating curve. This results in the high flows, and in particular, the peak flows showing an inconsistent relationship with other stations on this stream. These high flows will be revised, if and when high water affords the opportunity of making measurements to definitely define the shape of high water curves.

Station located at Low Water bridge, 0.8 mi. below U. S. Highway 40 bridge, 2.3 mi. SW of Davis. Tributary to Yolo Bypass.

Note: Due to the lack of high water measurements during 1961-62, and the changing channel conditions at this station during this period, high flows shown were estimated from an extension of a log-log rating curve. This results in the high flows, and in particular, the peak flows showing an inconsistent relationship with other stations on this stream. These high flows will be revised, if and when high water affords the opportunity of making measurements to definitely define the shape of high water curves.

Station located near center of Friant Dam on San Joaquin River, immediately above Cottonwood Creek, 0.9 mi. NE of Friant. Usable capacity, 503,000 ac.-ft. between elevations 375.4 and 578.0 ft. above mean sea level. Not available for release, 17,400 ac.-ft. Inflow to Friant Reservoir takes into account change in storage, release, spill, precipitation, and evaporation, and is representative of the natural flow which would pass the dam site if the dam had not been constructed. Figures shown under total discharge are computed inflow to the reservoir. Period of record for computed inflow is shown under period of record for discharge. Records furnished by U.S.B.R.Drainage area is 1,633 sq. mi.

Station located 6.0 mi. NW of Raymond on Raymond Road. Elevation of station is approximately 600 ft. USCOS datum. This station was installed in cooperation with Madera County and Chowchilla Water District. It is a flood control warning station, equipped with a Stevens Surface Detector and Telemark. Low flows are not recorded. Prior to 1962, high flow records were insufficient for publication. Discharge measurements and partial records are available in DMR files for period prior to 1962 water year. Add 500 ft. to gage heights to obtain elevations.

This station was installed in January 1962 for the Lower San Joaquin Flood Control Project. The main function of this station is to house the float for the electrically operated control gates. It is owned and will be operated by D.W.R. This station has not been activated to date. Two current meter measurements have been made. Those measurements were made on 2/12/62 and 2/13/62 and the results of these measurements are shown in above table.

Station located at Airport Way bridge, 1.5 mi. E of French Camp. Supplementary water stage recorder located 0.5 mi. downstream. Tributary to San Joaquin River. Backwater from temporary diversion dam at times affects stage-discharge relationship. During those periods, supplementary recorder used for computations. Maximum discharge listed at gage ht., site and datum then in use.

Station located 0.2 mi. above Farmington-Bellota Highway bridge, 0.2 mi. E of Bellota. Flow regulated by Hogan Reservoir. During irrigation season, flow is reregulated by boards placed across diversion dam immediately downstream which control division of water between the Calaveras River and Mormon Slough. This is flow from Calaveras River which is returned to the river vis Stockton Diverting Canal.

a Formerly listed as V N. Stevart, Jr.
b Nev installation in 1/2.
c An additional 24530 were feet was received from Butte Creek as 2 lines: November 1/30, April 5/10, May 4750, June 4460, July 3260, August 3100, September 2000, and October 1480.
b Finnerly listed as Leonard Newning.
c Replaces 2-6" units.
f Previrually listed as a 8" unit.
g In 1902 Jacinto Irrigation District, Mile 154.758, merged with

Olenn-Columa Irrigation District, Mile 154.8R. Total diversion for both plants in 1.62 and all subsequent years is listed at Mile 154.8R.

h An additional 33033 acre feet diverted by gravity from Stony Creek as follows: March 5445, April 20880, May 1408, and June 150.

i Konagricultural use.
j Formerly listed as Lloyd Hygelund.

k Plant moved from Mile 173.7L.

- Carries return water from Columa Basin along west border of Reclamation District 108 and 787, and then discharges to Secremento River at Mile 34.15R or partial diversion vis Knights Landing Ridge Cut.
   Mileage along Columa Basin Drain from junction with Bacramento River.
   One 10" unit was removed in 1962.
   Replaces at 2" unit.
   One 16" unit installed in 1962.

- d Installed prior to 1962, not previously listed.

  Formerly listed as Lloyd Kahn.

  Previously listed as 48.7L(0.1).

  Temporary installation during 1962.

  Includes 2816 acre feet of spill as follows: May 1848,
  June 166, July 60, and August 7-2.

  The 14" unit was installed in 1962.

Mileage is given northerly or southerly from N.rth Levee of Sacramento Bypass. Diversions from East Borrow Fit of Yolo Bypass are primarily from water diverted through Knights Landing Ridge Cut.
 The 16" unit replaces a 14" unit. The remaining 14" pump is a portable unit.
 One 16' unit was a temporary installation in 1962.

• Mileage in Butte Si ugh from junction with Barrament River at Mile 84.0L.
a Replaces a 16" unit
the 14" and 16" units were ten many installations during 1 #2.
Formerly Histed on Mary Lou Mulen.
One 16" unit was a temporary installation during 1 #2.

The " unit was a temporary installation during 1 #2.

Replace 2-10" units.

Fire in Butte Shough derived from Butte Creek, is "introlled by outfall gates at junction with Sacrament. River and is thereby retained in Butte Slough to discharge into East and West Eurove Pits of Sutter Bypass near "Long Bridge". The utfail gates are maintained by the Department of Water Resources and are operated cooperatively with the Butte Slough Irrigation Company. See Sutter Bypass Diversions.

- Mileages on West Borrow Pit are given northerly from drain plant of Reclamation District 1500. Mile 9.15 on West Borrow Pit is opposite Chandler.
   Mileages on East Borrow Pit are given nurtherly #\* southerly from Chandler.
   Plant is on main drain canal for Drainage Plant B . 1 that joins East Borrow Pit of Sutter Bypass at Mile 1.0% Figure in parentheses indicates distance along drain from East Borrow Pit.
   Plant is on drainage canal for Drainage Plant B0.2 that joins East Borrow Pit of Sutter Bypass at Mile 1.0% Figure in parentheses indicates distance along drain from East Borrow Pit of Sutter Bypass

- at Mile 16.5M. Figure in parentheses indicates distance along canal from East Borrov Pit

  Flant is on Foodle Greek that joins East Borrov Pit of Sutter Bypass at Mile 16.7M. Figure in parentheses indicates distance along creek from East Borrov Pit.

  Water used for irrigation in Sutter Bypass is mainly Feather River return water which enters East and West Borrov Pits via Butte Creek, Butte Slough, and Wadsworth Canal
  One 12" unit was removed in 1962.

  Plants formerly listed at Miles (1.35) and (1.36) are now combined and listed at Miles (1.35).

  Bev installation in 1962.

Diversions abown in this table below Mile 7.2 are considered as Delta Uplands Diversions.

No Putah Creek water diverted by this pump. Water diverted was water pumped into Putah Creek from Yolo Bypass (West Cut) by pump at Mile 17.1R(1.4).

b Temporary installation.
c Used leas than one scre-foot.
d Fortable unit used at Mile 25.6R and Mile 25.8R.
e New installation in 1962.
f Owner claims 40 acres of irrigated land. Evidence shows
t 2 scres irrigated.

Diversions shown in this table below the M:Connell Osging Station are considered as Delta Uplands Diversions. Tidsl effect ceases at about Mile 3.5.
 This diversion will not be measured after this irrigation aeason, due to a cutback in the diversion program. This

cutback necessitated the dropping of all diversion points on this stream above the lowest gaging station, b Formerly listed as J. L. Nix. c Includes an undetermined amount of spill to the Cosumnes River.

Diversion shown in this table below the Stockton gaging station are considered as Deita Uplands diversions. Right bank diversions below Mile 2.0 and left bank diversions below Mile 0.7 are not included since they serve areas that are considered to be within the Delta Lowlands. Tidal effect ceases at about Mile 5.0. North Slough - North Slough diverts from Calaveras River at Mile 21.6R. Distance from Calaveras River at Mile 21.6R. Distance from Calaveras River at Mile 25.3L, and rejoins the river through Stockton Diverting Canal. Distance from Calaveras River and bank is shown in parentheaes.

88 Stockton Diverting Canal - Stockton Diverting Canal divers from Mormon Slough at Mile 8(1\*.0) and rejoins the Caleveras River et Mile 5.4L. Distance from Caleveras River and ba k is shown in parentheses.

8 This diversion will not be measured after this irrigation seasor, due to a cutback in the diversion program. This cutback necessitated the dropping of all diversion points on this stream above the lowest gaging station.

b Formerly listed as a 6" unit.

c This diversion dropped in 1961 due to a cutback in the diversion program.

d Plant moved to Mile 15,6L.

e Formerly listed as 0c deMartini.

f Formerly listed as 0. R. Shelley.

- Mileage along Old San Joaquin River from mouth of San Joaquin River 4½ miles below Antioch.
  Mileage along Tom Paine Slough from its mouth at Mile 54.3 Lon Old San Joaquin River.
  Mile and bank above mouth.
  Holly Sugar Corporation Dredger Cut joins Tom Paine Slough at Mile 2.18. Distance along dredger cut and bank is abown in parentheaes.
  Rock Slough joins Old San Joaquin River at Mile 30.5L. Pumping plant is located on intake canal which joins Rock Slough.
  Indian Slough joins Old San Joaquin River at Mile 36.5L. Pumping plant is located on intake canal which joins Indian Slough.

- Pumping plant is located on Intake canal which joins Italian Slough.

  Plant is located on Intake canal which joins Italian Slough.

  Plant is located on intake canal which joins the Old San Joaquin River at this mile.

  Plant is located on Mountain House Creek which joins the Old San Joaquin River at this mile.

  New installation in April 1962.

  Formerly listed as attilio Casserini.

  Fremely listed as E. Platti, J. Obulardt and T. Silveira.

  Includes an undetermined smount of water returned to the river by spill.

  Replaced a 5" unit in May 1962.

  A 14" and 16" pump replaced a 12" and 24" pump.

  Mew installation in 1962.

Mileage along San Joaquin River from ita mouth 4½ milea below Antioch.
 Includes an undetermined amount of water returned to the river by spill.
 Installed a new 6" unit.
 Installed a new unit in 1962.
 Replaced a 15" unit in May 1962.

e Plant is located on Walthall Slough which joins the San Joaquin River at this mile. I Plant is located on Paradise Out which joins the San Joaquin River at this mile. I Plant is located on Old Channel which joins the San Joaquin River at this mile.

Pigures represent North Townships, East Runges and Sections. Letters represent the 1/4 - 1/4 sections which are lettered from A through Poet luding 1 and 0, similar to the numbering foethin within a township.
 Formerly listed as E. V. Lang.
 New installation in 199 .
 Permerly listed at Mile 3/5-55B.

d Includes an undetermined amount of March Creek water.
c Diversion in 1962 was all controlled drainage water.
f Estimated consumptive use on lands in the Pelts Uplands
considered as sub-irrigated from tidal channels during
1961 without a specific point of diversion.
g Includes undetermined amount of drain water.

- •• West Stanislaus Irrigation District Canal. The intake canal joins the San Joaquin River at mile 91.8L. Distance from the river and the bank is shown in parentheses.
   Mileage along San Joaquin River from its mouth, 4.5 miles below Antioch.
   Formerly listed as Cruze, Gonsalves and Moresco.

- The 16" unit was installed in 1962.

  c Two 16" units were installed in 1962.

  d Formerly listed as George Covert.

  e Includes an undetermined amount of water returned to river by spill.

  f Replaced a 10" unit in April 1962.

- Mileage downstream from Success Dam. Formerly reported as downstream from Junction with South Fork Tule River.
  Flow measured at gaging station on Campbell-Moreland Ditch located approximately 2600 feet below head.
  Record at this station has been discontinued.
  Flow measured at gaging station on Porter Slough Ditch located approximately 150 feet below head.
  Flow measured at gaging station on Vandalia Ditch located approximately 1600 feet below head.
  Flow measured at gaging station on Vandalia Ditch located approximately 1000 feet below head.
  The greater portion of this water was used to recharge Vandalia Irrigation Dietrict well field.
- Flow menaured at gaging station on Poplar Ditch located approximately 4750 feet below head. Flow mensured at gaging station on Hubbs-Miner Ditch located approximately 3400 feet below head except for the months of April, May, June, July, August, September, and October. The record for these months was furnished by Porterville Irrigation District because of backwater at the gaging station. Includes an undetermined amount of water diverted by the Gilliam-McGee Ditch. Flow measured at gaging station on Rhodes-Fine Ditch located approximately 3100 feet below head. Flow neasured at gaging station on Woods-Central Ditch located approximately 100 feet below head.

- Data for Maderw and Friant-Kern Canal furnished by USBR, all other data furnished by individual irrigation districts. An additional 85,813 acre-feet of water was pumped from wells. Of this acreage, 5,524 was double cropped. It does not include an undetermined amount of riparian water users acreage. An additional 125,570 acre-feet of water was pumped from wells. Of this acreage, 18,049 was double cropped. An additional 44,240 acre-feet of water was pumped from wells. Of this acreage, 10,905 was double cropped. An additional 509 acre-feet of water was pumped from wells.

- h Of this acreage, 311 was double cropped.

  1 Of this acreage, 237 was double cropped.

  2 Of this acreage, 868 was double cropped.

  3 This acreage also received 42,188 acre-feet of water from wells and controlled drainage.

  3 This acreage also received an undetermined amount of well water, and an undetermined amount of controlled drainage water from Oakdale Irrigation Diatrict. Of this acreage, 4,422 was double cropped. Includes 1,298 acres served by aubirrigation.

Station located 4.0 mi. E. of Colusa, 3.7 mi. N. of Meridian. Tributary to Sacramento River. Flow regulated by gravity culverts. These flows, together with flow of Butte Slough at Mawson Bridge and Wadsworth Canal at Butte Bouse Road are, during the summer months, made up almost entirely of return water from lands irrigated by Feather River diversions.

Station located 0.1 mi. below highway bridge, 1.7 mi. E. of College City. Flow is drainage chiefly from lands irrigated by Glenn-Coluss, Provident, Princeton-Codors-Glenn, Compton-Delevan, and Maxwell Irrigation Districts. Backwater from Knights Landing Outfall Gates at times affects stage-discharge relationship. Maximum gage height listed does not necessarily indicate maximum discharge. Results of measurements listed in supplementary table in report.

Station located at Knights Landing Outfall Gates, 0.3 mi. W. of Knights Landing. Tributary to Sacramento River. Flow regulated by outfall gates. An undetermined amount of flow is diverted to Yolo Bypass via Ridge Cut at Knights Landing. For total flow to Sacramento, combine with flows of Reclamation District 787 to Column Basin Drain. Maximum gage height listed does not indicate maximum discharge.

Station located just above the Southern Pacific Railroad bridge, 13.1 mi. above Feather River immediately NE of Knights Landing. Station affected by backwater from Feather River and Sutter Bypass during periods of high flow. Maximum discharge of record listed is for period 1940 to date. Records furnished by U.S.G.S. Maximum gage height listed does not necessarily indicate maximum discharge.

Station located at West Butte-Meridian Highway bridge, 3.0 mi. N. of Meridian. Tributary to Sutter Bypass. Flow affected by gate operation. Flow during aummer months is made up almost entirely of return water from lands irrigated by Feather River diversions. During flood periods, Sacramento River water enters Butte Basin above Butte City by bank spill and spill over Moulton and Colusa Weirs.

# - Flood season only

Station located approx. 4 mi. S of Yuba City. Flow partly regulated by reservoirs and power plants. High flows rated by means of simultaneous current meter measurements of Yuba River near Marysville and Feather River at Yuba City. Record listed is not considered to have the same degree of accuracy as other records published in this report. Drainage area is 5,343 sq. mi.

<sup>8 -</sup> Irrigation season only # - Flood season only

Station located 1,000 ft. above I Street bridge, 0.5 mi. below the American River. Below approx. 35,000 c.f.s. the stage-discharge relationship is affected by tidal influence. Maximum discharge of record listed is for period 1921, 1948 to date. Records furn. by USOS.

Note: During periods of tidal influence, mean gage height listed is mean of four tides. See Table 108 for periods when tidal action is affected by flow.

Station located 6.0 mi. NW of Raymond on Raymond Road. Elevation of atation is approximately 600 ft. USCGS datum. This station was installed in cooperation with Madera County and Chowchilla Water District. It is a flood control warning station, equipped with a Stevens Surface Detector and Telemark. Low flows are not recorded. Prior to 1962, high flow records were insufficient for publication. Discharge measurements and partial records are available in DWR files for period prior to 1962 water year. Add 500 ft. to gage heights to obtain elevations.

f In order to machine process the data in this table, it was necessary to avoid negative gage heights. Subtract 10.00 feet to obtain recorder gage height.
A Tidal action affected by flow. Oage heighta listed are maximum and minimum stage for day.

In order to machine process the data in this table, it was necessary to avoid negative gage heights.
 Subtract 10.00 feet to obtain recorder gage height.
 A Tidal action affected by flow. Gage heights listed are maximum and minimum stage for day.

In order to machine process the data in this table, it was necessary to avoid negative gage heights.
 Subtract 10.00 feet to obtain recorder gage height.

In order to machine process the data in this table, it was necessary to avoid negative gage heights.
 Subtract 10.00 feet to obtain recorder gage height.
 A Tidal action affected by flow, Gage heights listed are maximum and minimum atage for day.

	LOCATION		MAXI	MUM DISCH	IARGE	PERIOD C	F RECORD		DATUM	OF GAGE	
		1/4 SEC. T, & R.		OF RECORD		DISCHARGE	GAGE HEIGHT	PER	HOD	2ERO	REF.
LATITUDE	LONGITUDE	M.O.B.8 M.	C.F.S.	GAGE HT.	DATE		ONLY	FROM	70	GAGE	DATUM

Station located on dock at U. S. Engineers Transportation Depat, 1.1 mi. below the Rio Vista bridge. Station affected by tidal action. Maximum gage ht. listed does not indicate maximum discharge.

In order to machine process the data in this table, it was necessary to avoid negative gage heights. Subtract 10.00 feet to obtain recorder gage height.

In order to machine process the data in this table, it was necessary to avoid negative gage heights.
 Subtract 10.00 feet to obtain recorder gage height.

LOCATION MAXIMUM DISCHARGE				PERIOD C	DATUM OF GAGE

Station located at NE corner of Bacon Island at junction of Middle River and Connection Slough. Station affected by tidal action. Maximum gage ht. listed does not indicate maximum discharge.

<sup>\*</sup> In order to machine process the data in this table, it was necessary to avoid negative gage heights. Subtract 10.00 feet to obtain recorder gage height.

Station located on wharf at city water works immediately N of Antioch. Station affected by tidal action. Maximum gage ht. listed does not indicate maximum discharge. Maximum gage ht. at datum then in use.

## LAHONTAN REGION

### LAHONTAN REGION

### Introduction

The Lahontan Region covers the same portion of eastern California as does the Lahontan Water Pollution Control Region 6.' This report presents data from that portion of the region north of the Mono divide. The principle stream systems in the area rise on the eastern slopes of the Sierra Nevada and the Cascade Range and drain into inland lakes or sinks. Data tabulated in this report show daily mean discharge at stations in Surprise Valley and Eagle Lake, Honey Lake, and Lake Tahoe basins.

Storms crossing the mountains along the western edge of the area lose much of their moisture before entering the area and precipitation ranges from 50 inches at the higher elevations to less than 10 inches along the eastern edge. Streamflow results from surface runoff and snowmelt principally at the higher elevations.

The 1961-62 water year was near normal for the first time since the 1957-58 water year. In the Lahontan Region precipitation was near normal and runoff about 110 percent of normal.

## Tabular Information

On the following pages data are tabulated for 11 gaging stations for the 1962 water year.

Station located on east shore, 14 mi. NW of Susanville. Maximum gage height listed does not indicate maximum discharge.

## SAN FRANCISCO BAY REGION

### SAN FRANCISCO BAY REGION

### Introduction

The San Francisco Bay Region covers the same portion of coastal California as does the San Francisco Bay Water Pollution Control Region 2. Stream systems in this region drain the western slopes of the coastal ranges and includes the mouth of the Sacramento River. Streamflow in this area results from surface runoff and is sustained through the summer by ground water seepage from the soil mantle.

The 1961-62 water year in this region was 80 percent of normal runoff. It was greatly improved over the last three years.

### Tabular Information

On the following pages, data are tabulated for two gaging stations and daily maximum and minimum tides on Suisun Bay at Benicia and Sacramento River at Collinsville for the 1962 water year.

Station located in Shasta Dam, 2 mi. below Squaw Creek, 9.5 mi. N. of Redding. Usable capacity, 4,377,000 acre feet between elevations 737.75 and 1,065.0 ft. above mean sea level. Not available for release, 115,700 acre feet. Inflow to Shasta Lake takes into account change in storage, release, apill, precipitation, and evaporation, and is representative of the natural flow which would pass the dam site if the dam had not been constructed. Period of record for computed inflow is shown under period of record for daily content is shown under period of record for stage. Records furnished by U.S.B.R. Drainage area, excluding Goose Lake Baain, is 6,665 square miles.

Station located near center of Monticello Dam, 7.5 mi. W of Winters. Records furn. by USBR. Drainage area is 577 sq. mi.

Lake Berryessa has a usable capacity of 1,592,000 ac. ft. between elevations 253.25 and 440 ft. Not available for release is 10,340 ac. ft.

Daily content shown is at 12 Noon. Period of record is shown under period of record for gage height.

CURRENT METER MEASUREMENTS AT MISCELLANEOUS SITES
Measurements of stream il w at points other than gaging stations or at points where flow has not been computed are listed in the following table

			Measurements				
Stream	Tributary To	Location	Date	Gage Height (ft)	Diecharge (cfs)		
Ash Slough et Tyler Road	San Joaquin River	Sec. 12 T10S R14E	2/17/62	3.82	1210
