FOREWORD

The winter of 1974-75 for California was relatively dry through January, but the earlier lack of precipitation was offset during February and March by abundant rainfall and a heavy late-season snowpack. Despite these occurrences, the State passed through the season without major flood damage. The Eel River in Humboldt County produced the most notable flooding that did occur, and mud and rock slides in Humboldt and Los Angeles Counties caused most of the storm-related damage.

Bulletin No. 69-75, the 13th in an annual series of reports on high-water events in California, presents information on flooded areas and storm damage during the 1974-75 water year (October 1 through September 30). The Bulletin also describes the general weather patterns preceding and during the significant storm periods, the precipitation characteristics of these storms, and the resultant runoff. Included are tabulations of precipitation comparisons and peak streamflows and stages, hydrographs of stream stages and reservoir operations, and weir overflow graphs.

In addition to data compiled by the Department of Water Resources, information for the report was supplied by the National Weather Service, the U. S. Geological Survey, the U. S. Army Corps of Engineers, the U. S. Bureau of Reclamation, and many other public and private agencies. The assistance of the cooperating agencies is greatly appreciated.

STORMS AND STORM DAMAGE OF THE 1974-75 SEASON

The weather for California during the winter of 1974-75 occurred in two distinct segments. The first was generally characterized by a high-pressure ridge along the Pacific coast from October 1974 through January 1975 that resulted in subnormal precipitation for most of the State (Figure 2). The second part of the winter was characterized by an upper-level trough over the eastern part of the Pacific Ocean which brought above-normal precipitation for February and March, 1975. These two wet months more than compensated for the previous dry ones in many areas of the State and brought the seasonal total precipitation up to and above normal (Figure 3). More detailed descriptions of seasonal precipitation are presented in the Department's Bulletin No. 120-75; "Water Conditions in California", Reports Nos. 1 through 4. Table 1 presents the rainfall amounts accumulated in each period at selected stations.

Heavy Rains Cause Floods, Mud Slides

Several Freeways Close; Roofs Collapse Under Weight of Water

BY JACK JONES
Times Staff Writer

Intense, pounding rain flooded intersections, collapsed roofs, forced homeowners to evacuate, submerged cars and generally caused problems throughout Southern California today before the season's worst storm moved on.

With Los Angeles getting a storm total of 1.63 inch overnight, some of the worst local flooding was in the Carson-Lomita area, where water was reported up to 10 feet deep at one spot.

when lines fell at 139th St. and Crenshaw Blvd.

Tuesday night, a 3-square-mile area of Palos Verdes Estates was blacked out and the police department had to switch to auxiliary power.

About 2,000 Department of Water & Power customers in central Los Angeles were without power for 20 minutes when water disrupted entitlement. There were spot outages

October 1974 through January 1975

Most of October 1974 was an extension of the preceding long, dry summer, but near the end of the month a weather system brought sufficient rainfall to most of the State to nearly equal the amounts normal for October. Rainfall during November was fairly evenly distributed throughout California, but was generally less than 50 percent of normal for the month.

The first week of December brought the first significant storm of the season, with high winds and some heavy rain which extended even into Southern California. Precipitation amounts from that storm generally ranged from one to three inches, but because it was the first major rainfall, the runoff to major streams was not excessive. Los Angeles County reported that some earth slides and local flooding occurred, and some roofs collapsed on several commercial buildings. The Sacramento River rose to the top of Tisdale Weir but no overflow to the bypass system occurred. Rainfall during the remainder of the month drifted back into the subnormal pattern of the previous month.

This below-normal trend extended through January, bringing the seasonal total precipitation throughout most of the State to less than 80 percent of normal. The basic cause of this extended subnormal precipitation was an unusual high ridging along the west coast near the 120°-130° West longitude which blocked the customary path of storm systems traveling eastward and pushed the storms into a more northerly route. This pattern left California on the outer fringes of most of the storms; only a few (such as the December 3-5 storm) were able to break through.

February through April, 1975:

By February 1975, the normal seasonal atmospheric activity began to overtake and to overcompensate for the anomalous pattern of the previous three months. The mean ridge was forced eastward, and a cold upper-level trough that formed over the eastern Pacific became the prominent circulation feature for the next two months, causing winter storm systems to track through California.

During the first week of February, a series of cold fronts moved out of the Gulf of Alaska into California bringing significant precipitation with a very low snowline. By February 4, a blocking high developed in the upstream ridge over southern Alaska, causing the flow into California to move from a more westerly direction and

Minor Floods In Heavy Rain

Heavy rains caused minor flooding throughout Sonoma County Friday as nearly one and one-half inches fell in Petaluma.

Friday s storm, which reportedly will be followed by another large storm tomorrow, brought the total rainfall locally to 21 47 inches since July 1, 1974 still below last year s mark of 24 88 inches at this time

As the photos show, low areas throughout Petaluma were under water but drainage ditches were able to handle the flow No major damage was reported.

Elsewhere in the Bay Area, however, numerous power lines were knocked down causing blackouts and loss of telephone services.

The California Highway Patrol office in Santa Rosa was one of the victims of the storm, losing regular power and phone service leaving the station with limited radio use and no phones

The Sonoma County Sheriff s office reported that all roads remained open and the Russian River was expected to crest at 29 feet today, three feet below flood stage.

SONOMA COUNTY
March 22, 1975

Sneak Storm Hurls Rain, Snow, Wind on Bay Area

PAGE 1

A vicious storm carrying snow, high winds, heavy rains and hail sneaked into the Bay Area today, crippling traffic in some areas and causing road closures and flooding

Several inches of snow was reported in the Oakland and Berkeley hills, in Montclair, and along the freeway from the Caldecott Tunnel all the way to Walnut Creek

Authorities closed Grizzly Peak Boulevard, Fish Ranch and Wildcat Canyon roads as the snow line from the unexpected storm lowered to the U C campus in Berkeley

Heavy snow fell on both Mt Diablo and Mt Tamalpais, closing the roads into the state parks

Although the forecast had called for only cloudiness and daytime temperatures in the high 50s to mid 60s the thermometer hovered between 38 degrees at San Francisco International Airport and 41 at Oakland International Airport at midday.

Small craft warnings were posted in the afternoon for northwesterly winds gusting up to 40 miles per hour, decreasing tonight. When the forecast finally was revised, it called for rain or snow turning to showers tonight and early tomorrow Lows tonight were expected to be in the 30s and low 40s, the weather service said

The heavy rains caused flooding along the Nimitz Freeway from High Street to below the Oakland Coliseum

Snow fell on the hills of all the Bay Area counties above about 1,000 feet Roads were closed locally over a wide area

Nearly a score of flooded homes in Dana Point and Capistrano Beach and severe rockslides that twice closed Pacific Coast Highway north of San Clemente marked the most serious damage from the storm front that hit the South Orange Coast Monday and early today.

Orange County firemen were summoned to 18 homes in Dana Point and Capistrano Beach Monday afternoon to remove water that crept in under doors after street gutters filled with storm runoff

Streets particularly affected were Pacific Coast Highway in Dana Point and Calle Fortuna Calle Portola, Via Saeramento and Via California in Capistrano Beach a fire department spokesman said

[illegible] county firemen vacuumed water from the homes; state highway crews worked through the evening hours to clear tons of debris from Coast Highway between Palisades Drive and

bringing warmer air masses and high snowlines. (This development was reminiscent of the early January 1974 storms which subsequently produced the disastrous Dunsmuir floods). A series of seven weather fronts brought substantial precipitation to Northern and Central California during mid-February. Rainfall in Northern and Central California ranged from near normal to almost 200 percent of normal for the month.

Although the runoff produced by these storms did not develop into the magnitude of the January 1974 runoff, it was sufficient to bring several Northern California streams to flood stage. The Eel River on the north coast exceeded flood stage in the river's delta, necessitating the evacuation of several farm families and numerous head of livestock; the Russian River exceeded flood stage near Guerneville by about 4-1/2 feet (1.4 metres), but no major damage was reported; the Sacramento River reached flood stage at Tehama Bridge and Vina Woodson-Bridge, and also caused overflow to the bypass system at Moulton, Colusa, Tisdale, and Fremont Weirs (Figures 13 and 14). Near the southern end of the Yolo Bypass, water went over the top of a private levee and flooded Little Holland tract, destroying a newly planted crop.

The cold, wet weather regime which began in early February presisted through March. Central and Northern California received precipitation that ranged from almost 150 percent of normal to more than 300 percent of normal during March.

Early in the month, a brief but intense cold storm was centered on the south coast. A precipitation station at Topanga in Los Angeles County reported 3.65 inches (92.7 millimetres) of rain in a 24-hour period on March 6. The storm produced local flooding and mud and rock slides in Topanga Canyon and other locations in the Santa Monica Bay area, but no major damage was reported.

Another intense cold storm centered in the San Francisco Bay area on March 13 brought high winds, heavy rain, hail, and a low snowline which blanketed the Bay area hills above an elevation of 1,000 feet (305 metres), crippling traffic and causing much local flooding.

The most significant storm of the season occurred on March 17 and 18. This system involved a slow-moving front that entered the northern part of the State and brought the most intense rainfall that the north coast

FRESHWATER CREEK, EAST OF EUREKA, MARCH 19, 1975

was to experience during the winter. Several stations reported 24-hour totals exceeding 8 inches (200 millimetres). Table 2 presents storm totals for several north coast precipitation stations during this period; Figures 4 and 5 are isohyetal representations of this storm over the north coast and Sacramento Valley.

Gasquet Ranger Station	9.0	(230)

Along the north coast, this mid-March storm produced flood stages on the Smith River near Crescent City and at Dr. Fine Bridge (Highway 101) in Del Norte County, and on the Van Duzen River near Bridgeville and the Eel River at Fernbridge in Humboldt County. No major damage was reported in Del Norte County; however, damage to public and private property in Humboldt County was estimated to be nearly $1.8 million, the greater part of which occurred when slides and slipouts struck State highways and county roads. Again, as in February, more than 1,000 head of livestock and several families in the Eel River delta had to be evacuated. On March 18, Humboldt County declared a local state of emergency, but no State or federal aid was requested.

The Sacramento River was the only other major stream to reach flood stage during the mid-March storm. This took place at Tehama Bridge and the Vina-Woodson Bridge, both of which lie downstream from the City of Red Bluff. No significant damage was reported at either of those locations. The Sacramento River bypass system carried

flood flows through the Sacramento Valley to relieve the main channel. Overflow to the Sutter Bypass began again on March 8 and continued through April 1; overflow to Yolo Bypass resumed on March 20 and ended on March 31. Little Holland tract, near the south end of the Yolo Bypass, was once again inundated, after having been drained and repaired following the February flooding.

No substantial rises in any major streams occurred after the middle of March. Several weather systems subsequently brought occasional heavy showers to the State which prolonged the moderate to high river stages.

Post-April Activity

The lateness of the season's major precipitation also produced a late snowpack accumulation; this, in turn, threatened to bring early spring flooding from snowmelt runoff. Fortunately, the upstream reservoirs were able to control the runoff, and no major flooding occurred. On June 1 and 2, in Stanislaus County, the Stanislaus River reached flood warning stage at Orange Blossom Bridge as a result of snowmelt runoff and rainfall from thunderstorms in the upper basin. During these flows, one person lost his life while attempting to raft down a reach of the river above Melones Dam. On the lower reaches of the Stanislaus River, the high stage caused closure of a State park and evacuation of livestock from low-lying lands.

Sporadic thunderstorms during the summer months caused some minor flash floods and road closures in the southern desert areas of the State. On September 9, 1975, a motorist was drowned when a flash flood swept her automobile from State Route 14 in eastern Kern County.

These late-season occurrences closed out the 1974-75 water year which had produced slightly above-normal seasonal precipitation for the State without major flooding.

Boiling Water Trees Rafters

The Stanislaus River, swollen by the Spring snow melt and churning up to 60 m.p.h., left three rafters, above, trapped and clinging to a tiny tree 10 miles north of Vallecito, Calaveras County, after their raft was snagged on debris yesterday. The three men were part of a raft party of five, identified by Bureau of Land Management ranger E. G. Hayes as San Jose policemen, who put their raft in only 20 feet upstream. Hayes said the men entered the river, along with other rafters, despite warnings of the "extremely dangerous flow." The men were pulled ashore by rescuers, the last one being brought to safety in the photo at right. The other two men were rescued earlier. Safe on the bank of the river, the off-duty policemen refused to give their names to a reporter. Another rafting party in the same area was not as fortunate. A six-man party from Stockton lost its raft in the same area. Five of them were rescued by other rafters but Merlyn Gunter, 28, was lost and presumed drowned. Hayes said he and other BLM employes warned all persons entering the river of the danger, but that they could not legally stop them. "These people just don't listen," he said.

APPENDIX B

Peak Flows and Stages
at
Selected Streams and Stations in California

INTRODUCTION

Appendix B presents data for selected stations on representative streams of the major hydrographic areas of California (Figure 1). The data are obtained from USGS Surface Water Records, Department of Water Resources' Bulletin No. 130, and U. S. Department of Commerce, NOAA, National Weather Service, Daily River Stage publications. Current water year data are preliminary and are subject to revision.

Stations are listed in a downstream direction along the main stream and tributaries. Stations on tributaries are listed between main stream stations in the order in which the tributaries enter the main stream.

LEGEND

USGS	United States Geological Survey
USBR	United States Bureau of Reclamation
NOAA	National Weather Service (National Oceanic and Atmospheric Administration)
USCE	United States Corps of Engineers
DWR	Department of Water Resources
PG&E	Pacific Gas and Electric Company
A	From flood marks
B	Discharge over weir or spillway
C	Site or datum then in use
D	Discharge not determined, affected by backwater or tide
E	Estimated
F	From DWR telemetering log
G	Preliminary
H	Includes flow through power plant
I	Due to failure of partially completed dam
J	Gage height revised
K	Flow through power plant not included
L	Discharge at latitude of gaging station site
M	Prior to construction of upstream dam
N	Includes flow through fish hatchery but not upstream diversion to Thermalito Afterbay
P	Observed
Q	Estimated peak inflow to partially completed Oroville Reservoir
R	Regulated stage and flow
S	Revised to current datum
T	Datum of gage is 0=0 USED
U	Crest stage partial recorder
N/A	Not available at report time
*	Peak of record established current year

METRIC EQUIVALENTS

1 square mile	= 2.59 square kilometres (km^2)
1 cubic foot per second (cfs)	= 0.028 cubic metre per second (m^3/s)
1 foot	= 0.305 metre
